PROFESSIONAL DEVELOPMENT

```
flag == 0:
lat_sp = raw_input("What is the latitude of quadrant split?")
if p1[1] < float(lat_sp) < p3[1]:
    flag = 1
    print ('Your latitude of quadrant split is valid.')
else:
    print ('That is not a valid input.')
return lat_sp

result_lat = lat_bound() #allows you to reference user input

#Set up function for longitude and ensure that valid longitude is entered
def long_bound():
    flag = 0
    while flag == 0:
        long_sp = raw_input("What is the longitude of quadrant split?")
        if p3[0] < float(long_sp) < p1[0]:
            flag = 1
            print ('Your longitude of quadrant split is valid.')
        else:
            print ('That is not a valid input.')
    return long_sp

result_long = long_bound() #allows you to reference user input
```
