

Counting microbes in Baltimore Harbor

Eric Schott
IMET-UMCES

March 15, 2023

**Rouse Family
Foundation**

Swimmable Inner Harbor Goal

Goal set in 2010 by the Waterfront Partnership
Baltimore under EPA, DOJ sewage consent decree

Associated with sewage and runoff

- **Human pathogens**

Naturally present in brackish water

- *Vibrio vulnificus*
- *Vibrio parahaemolyticus*

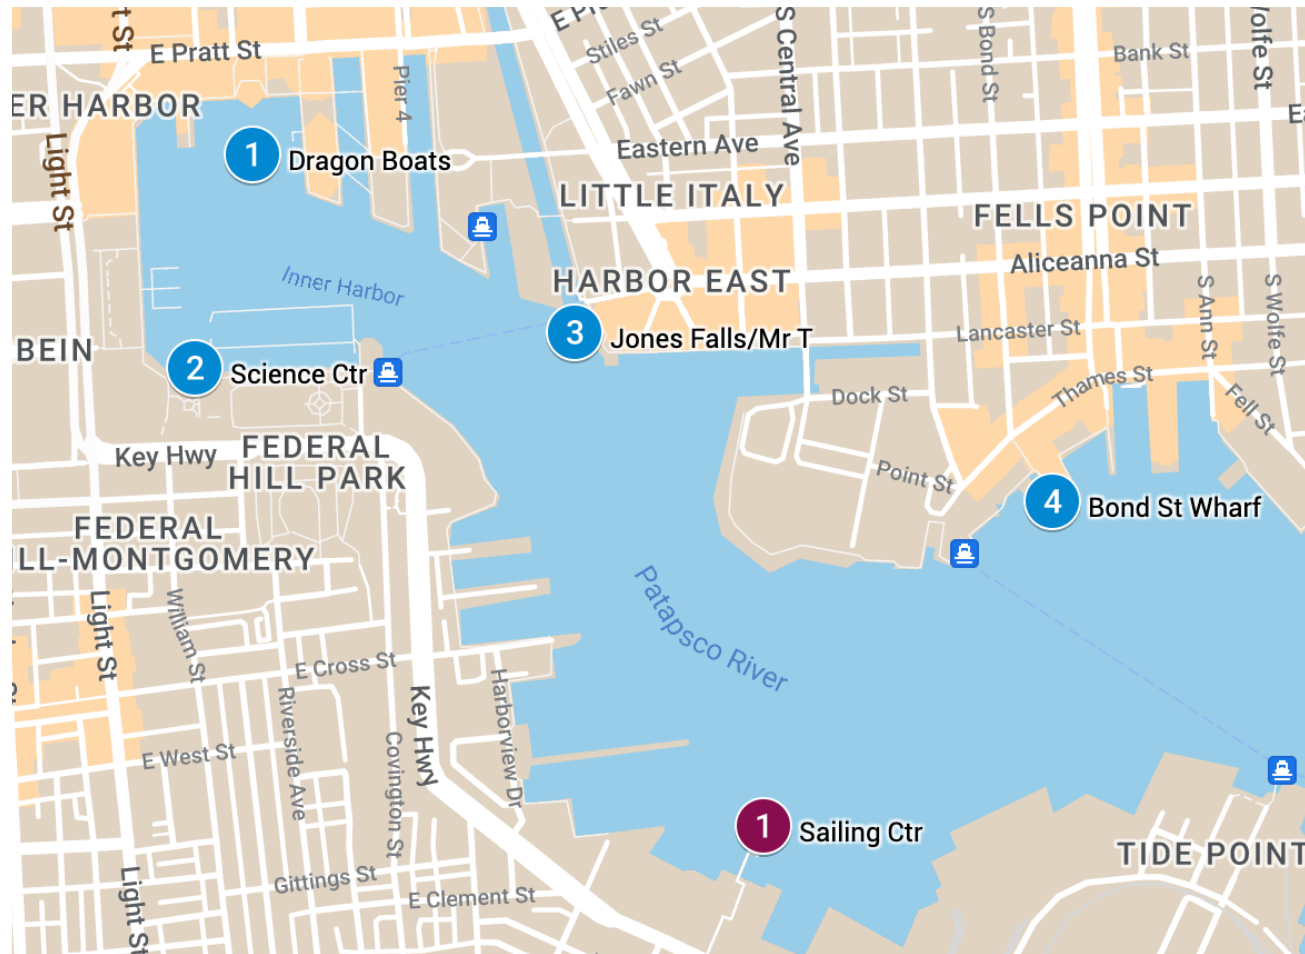

Study sites where water contact is frequent

WPB collections

2. Science Ctr
3. Jones Falls
4. Bond St Wharf

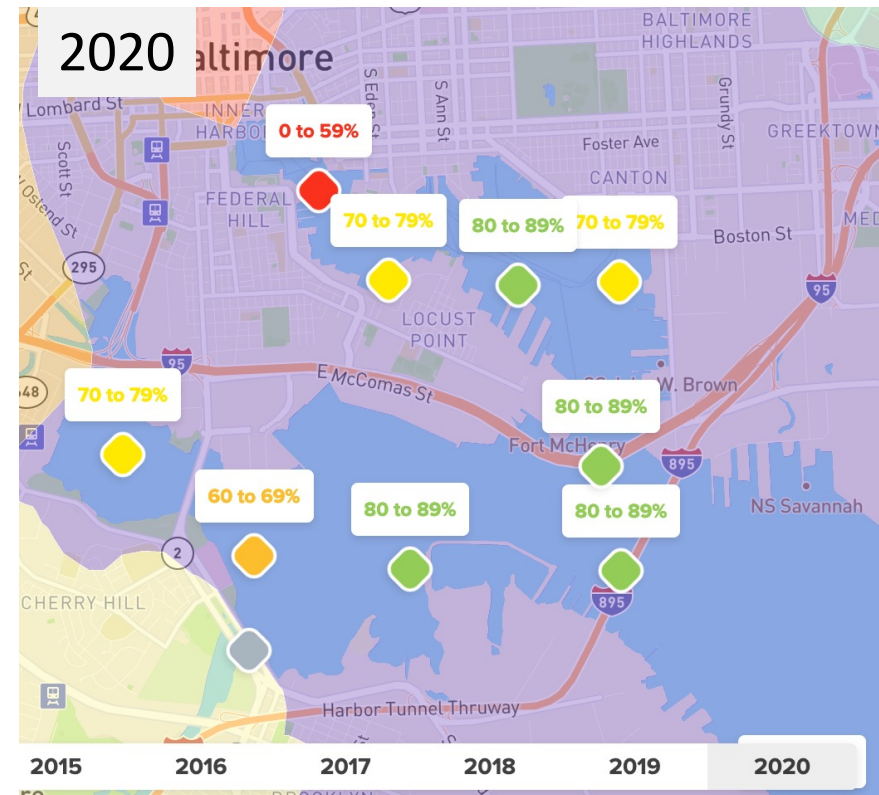

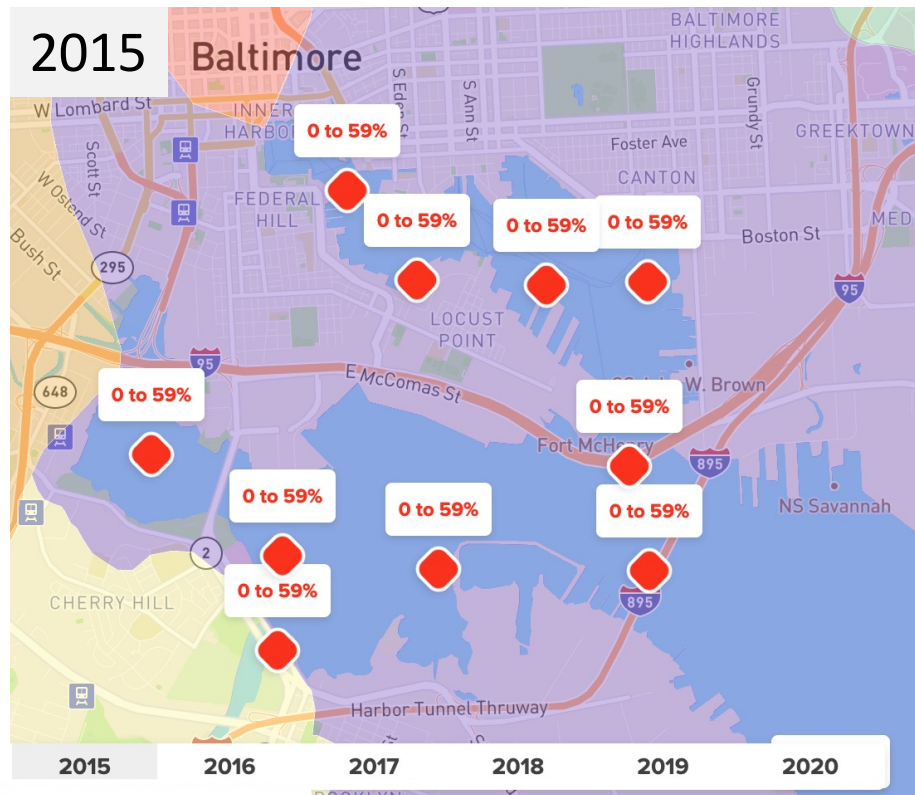

IMET collection

1. Sailing Center

The harbor is cleaner, but not always

How can we know **when** it's safe to swim?

IDEXX Enterolert methods

How to measure risk of sewage-related bacteria?

FIB: Enterococcus

colony plating- counting CFU. *18 hours*

IDEXX Enterolert – dilution method and MPN. *18 hours*

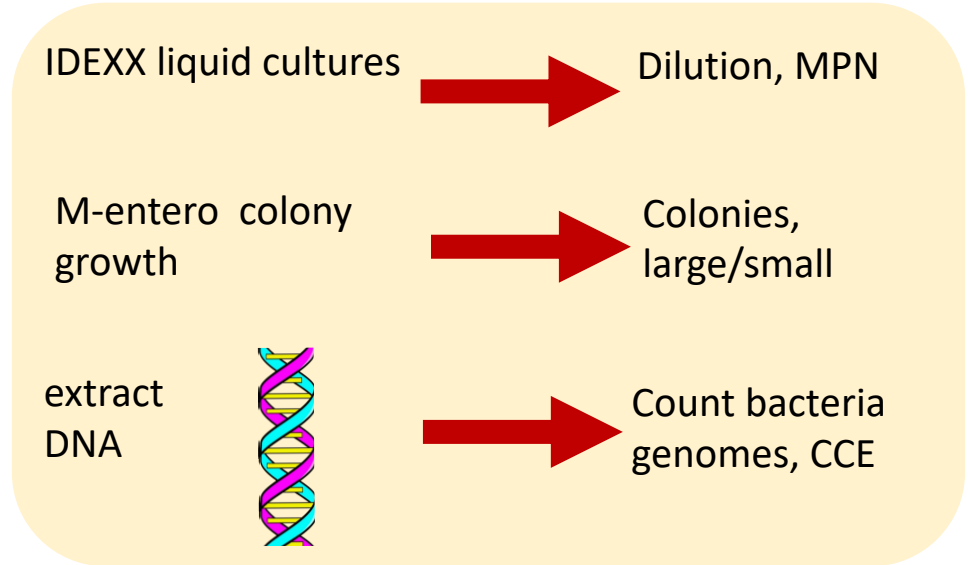

qPCR – EPA method 1611. *5 hours*

More human – specific bacteria, PCR

Bacteroides sp. – “HF183” Site-specific EPA approval.

Lachnospiraceae – Lachno3. Well-tested, no regulatory approval

Enterococcus measured three ways

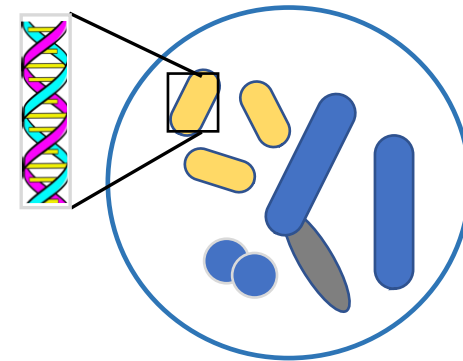

IDEXX

M-entero agar

EPA1611 qPCR

Enterococcus: Non-sewage sources

(Upper photo: Cladophora in Baltimore:

Same day qPCR for *Enterococcus*

Method 1611: Enterococci in Water by TaqMan[®] Quantitative Polymerase Chain Reaction (qPCR) Assay

Indicator	Estimated Illness Rate (NGI): 36 per 1,000 primary contact recreators	OR	Estimated Illness Rate (NGI): 32 per 1,000 primary contact recreators
	BAV (Units per 100 mL)		BAV (Units per 100 mL)
Enterococci – culturable (fresh and marine) ^a	70 cfu		60 cfu
<i>E. coli</i> – culturable (fresh) ^b	235 cfu		190 cfu
<i>Enterococcus</i> spp. – qPCR (fresh and marine) ^c	1,000 cce		640 cce

In 2020, 2021, IMET used qPCR to assess sewage markers and Vibrios
2022- trial of daily testing by Enterococcus

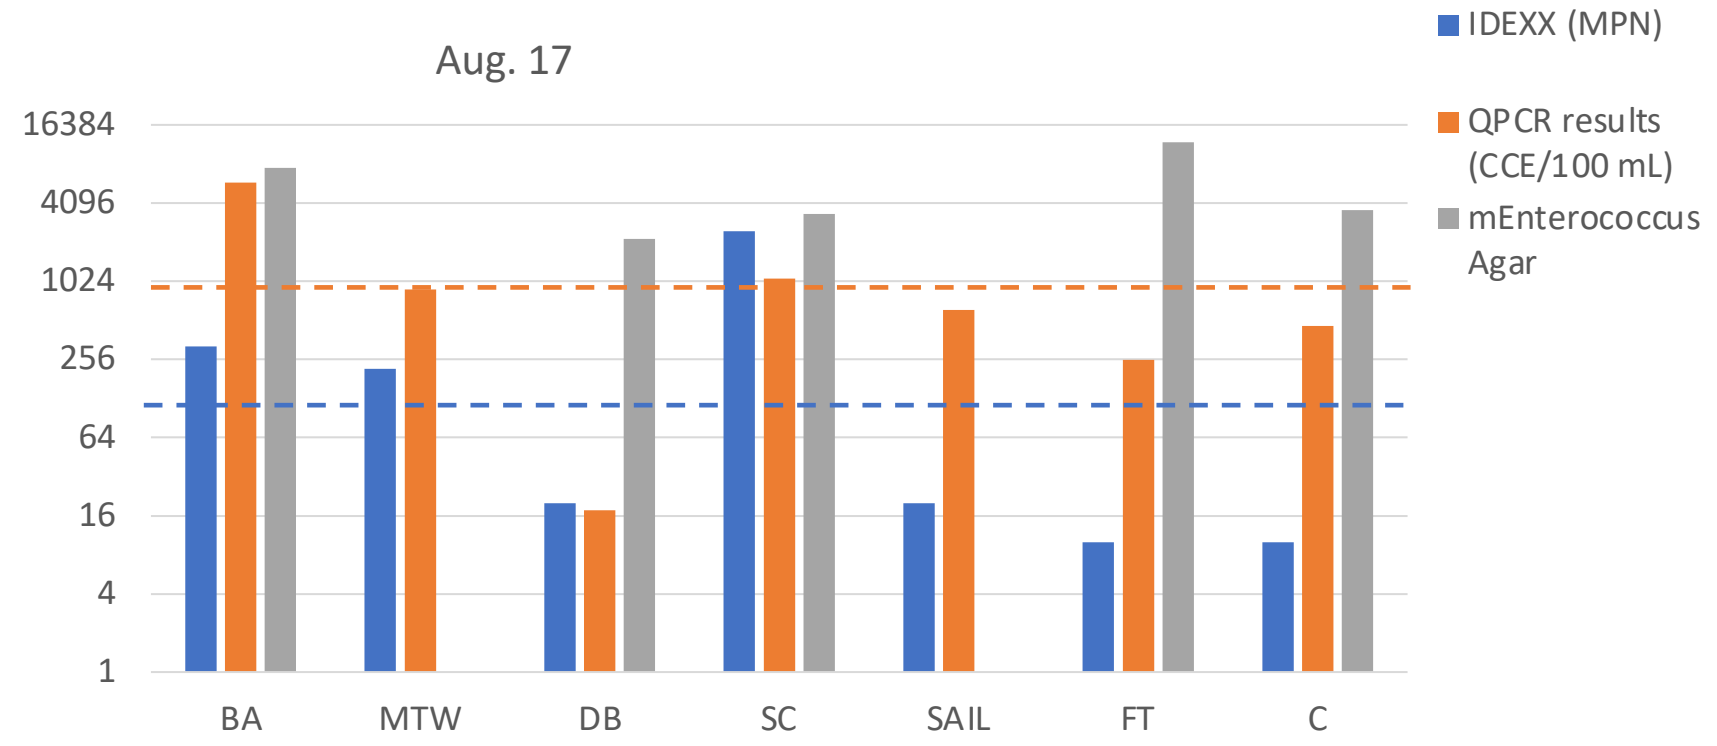

Weekly trends across the Inner Harbor

Weekly trends across the Inner Harbor

Summary- Enterococcus

We tested same-day qPCR for Enterococcus

- Eventually succeeded in 4-hour turnaround time
- But it raised questions about the correspondence between methodologies
- What about more specific methods?

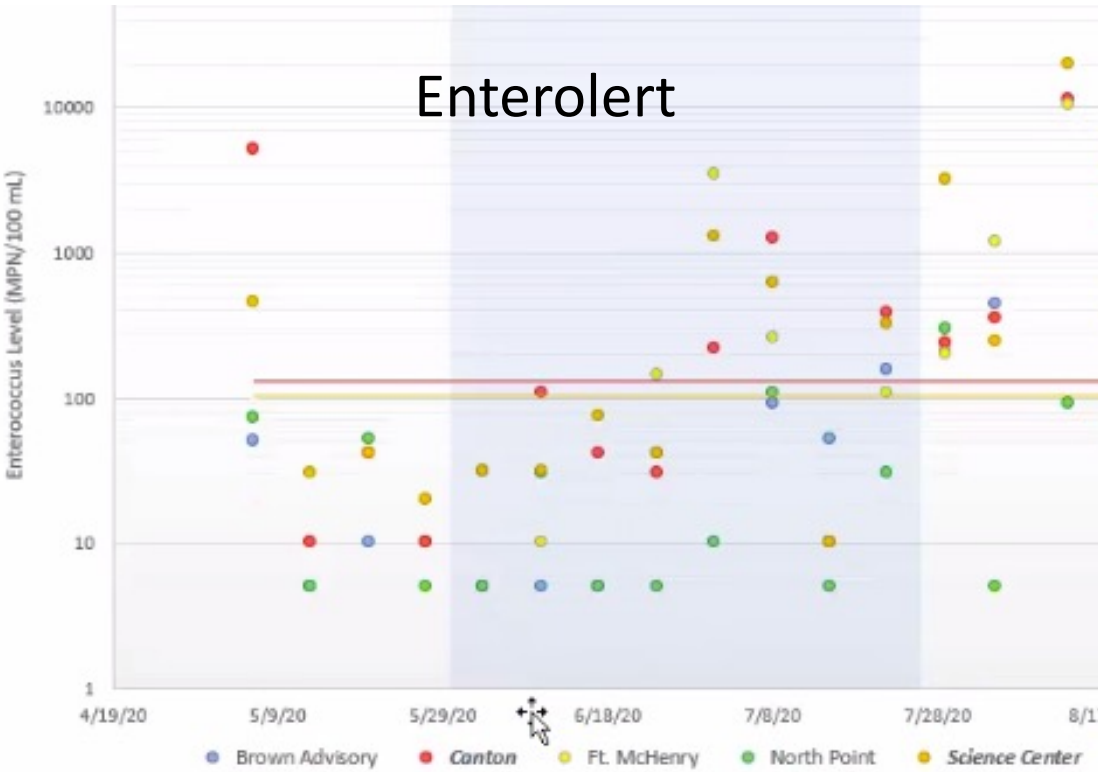

Improved HF183 Quantitative Real-Time PCR Assay for Characterization of Human Fecal Pollution in Ambient Surface Water Samples

V. vulnificus

Summer 2021

Summary and Conclusions:

Each Enterococcus method measures a different feature of the organism

It is increasingly recognized that FIB have limited utility for assessing risk

- Alternative markers are available

HF183 (human MST) has been in use 10 years and can get site specific EPA approval

Other molecular methods on the horizon:

- “Lachno3”

- Microbiome fingerprints

Human pathogenic Vibrios are present episodically

PCR technology with more specific markers can be used to assess recreational waters on the same day, with better certainty than FIB methods.
