About me

- Ph.D. Michigan State in Env. Engr.
- Postdoc Lawrence Berkeley National Lab
- Associate Editor, Water Resources Research
  Specialty Chief Editor, Frontiers in Water: Water and AI.
- “Grew up” as a process-based modeler, solving PDEs. See both sides of the story.
- Got into ML since 2016.

Overview

- ***What*** ML models have we got comfortable with?
- ***What*** is the fundamental strengths of ML models compared to process-based models?
- ***What*** is *differentiable modeling (DM) in geosciences*?
- ***What*** can DM bring into global hydrology?

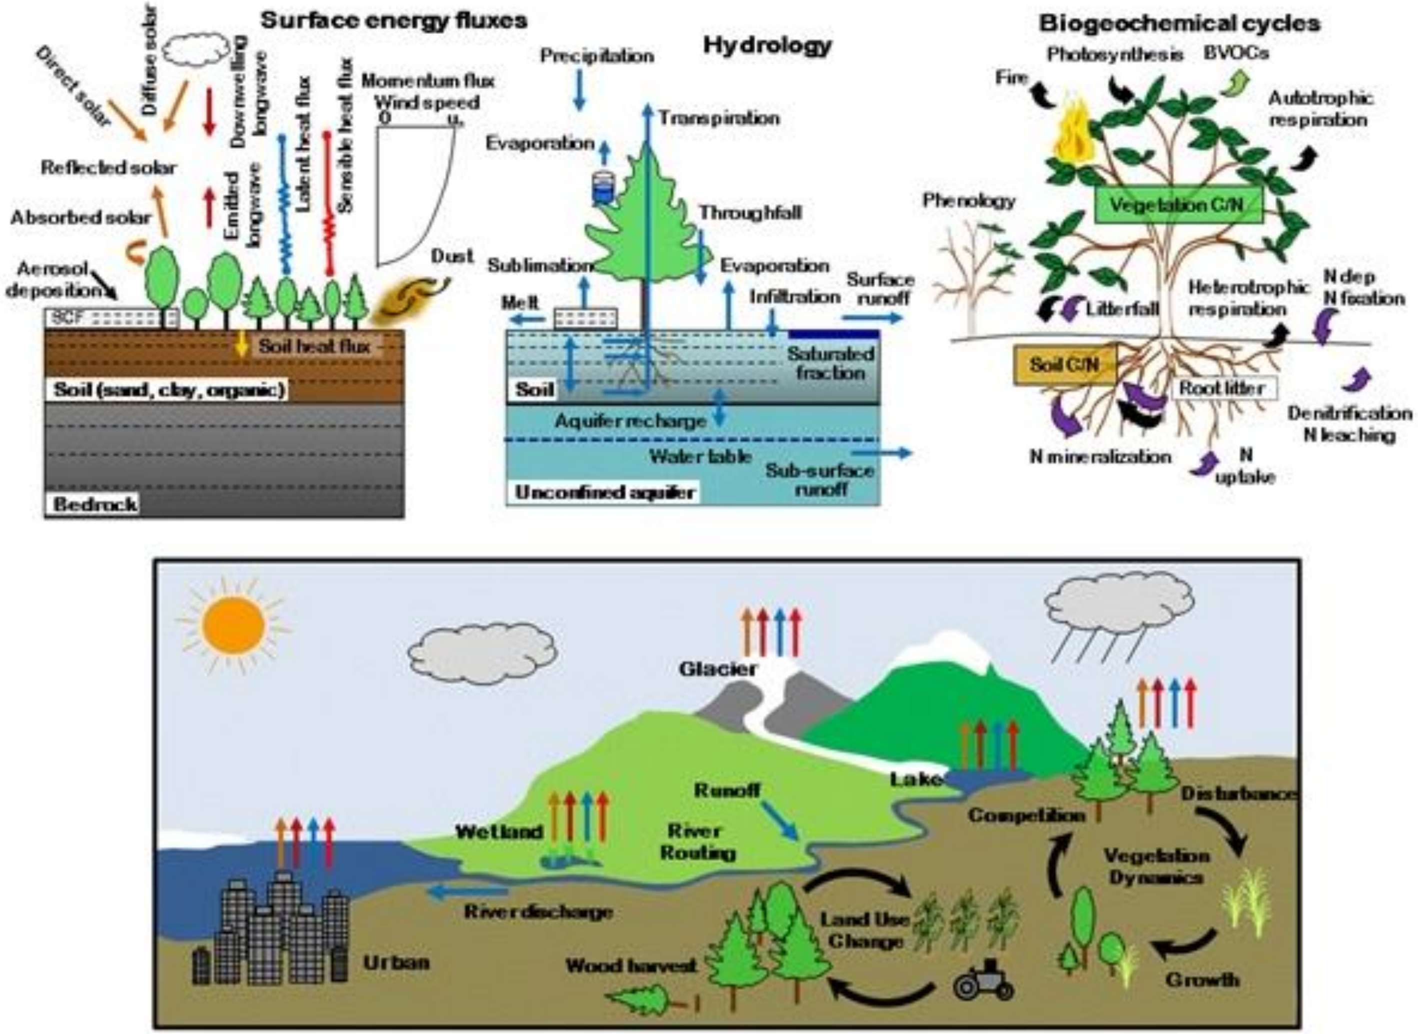
Differentiable modelling to unify machine learning and physical models for geosciences

A list of authors and their affiliations appears at the end of the paper

Process-based Earth-system models were highly valuable but some challenges emerged…



- Increasing complexity
- Difficult to evolve quickly with more big data.
- May contain problematic assumptions.
- Influenced by human intuition & biases

What is DL and why DL?

a rebranding of neural networks featuring

(i) Large capacity

(ii) Hidden layers that automatically extract features

(iii) Improved architecture/regularization

(iv) Working directly with data

Water Resources Research

AN AGU JOURNAL

Review Article | Open Access

A trans-disciplinary review of deep learning research and its relevance for water resources scientists

Chaopeng Shen

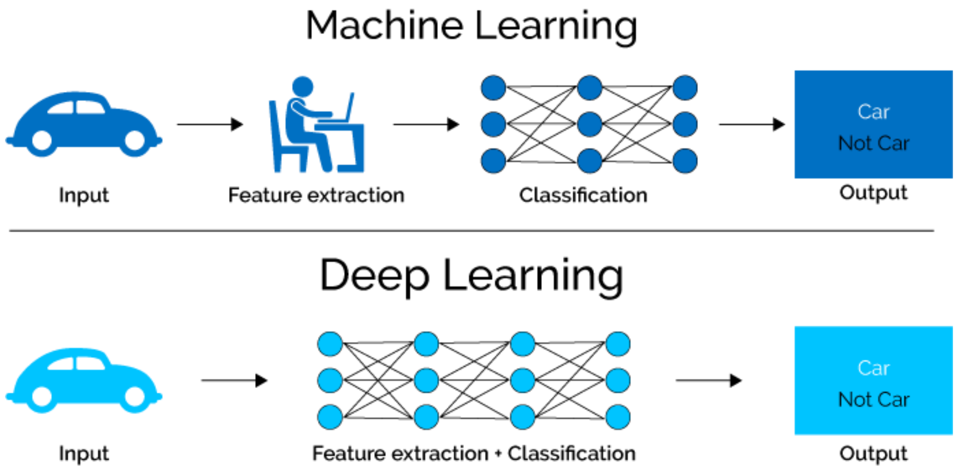
First published: 30 August 2018 | https://doi.org/10.1029/2018WR022643

$X \rightarrow Y$

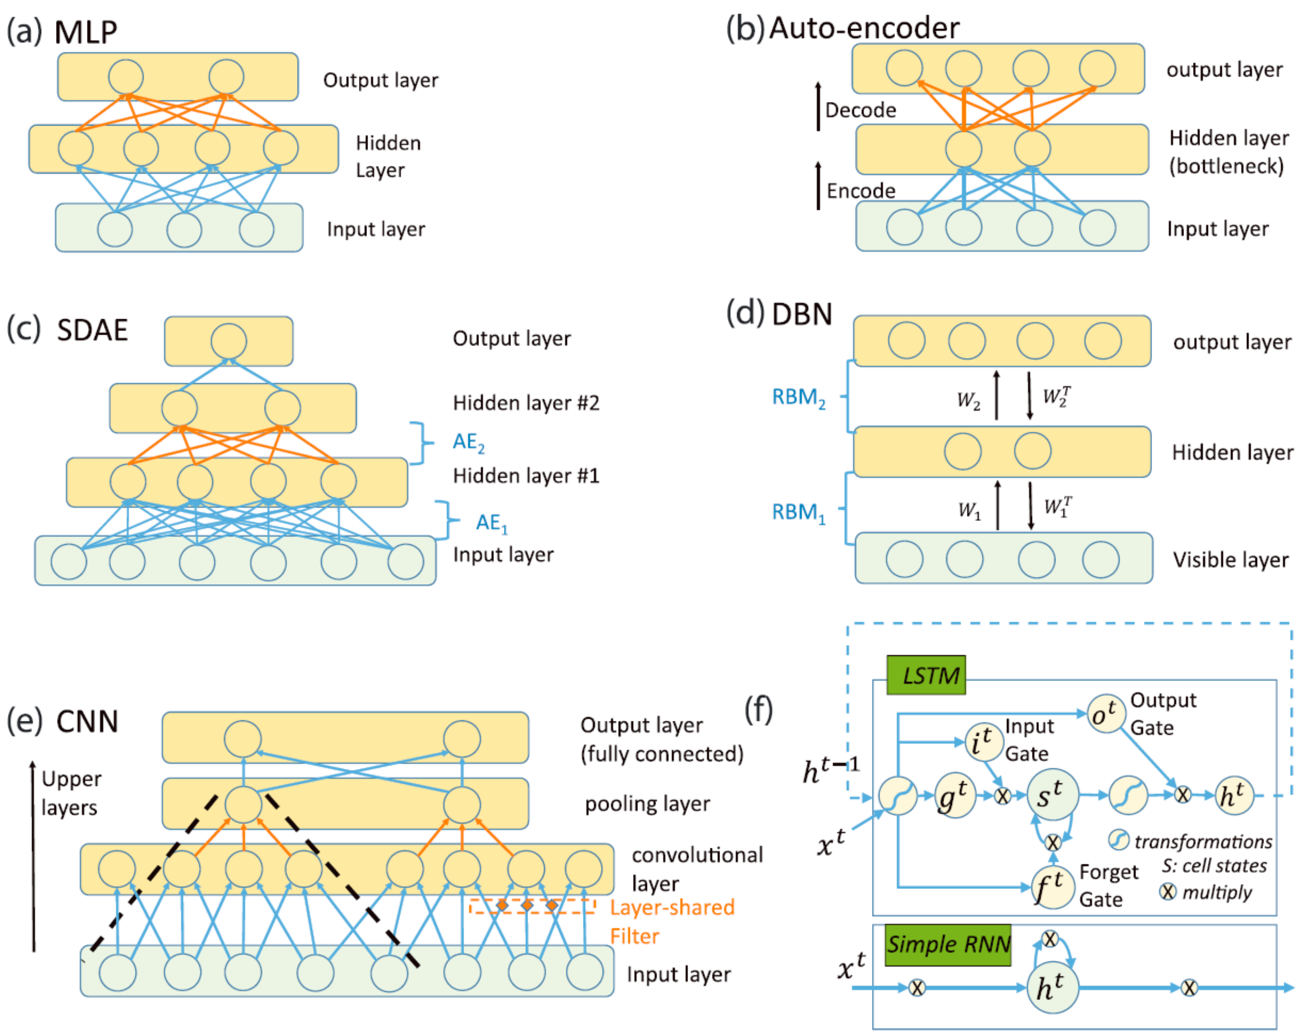
a primary value proposition is the avoidance of expertise!

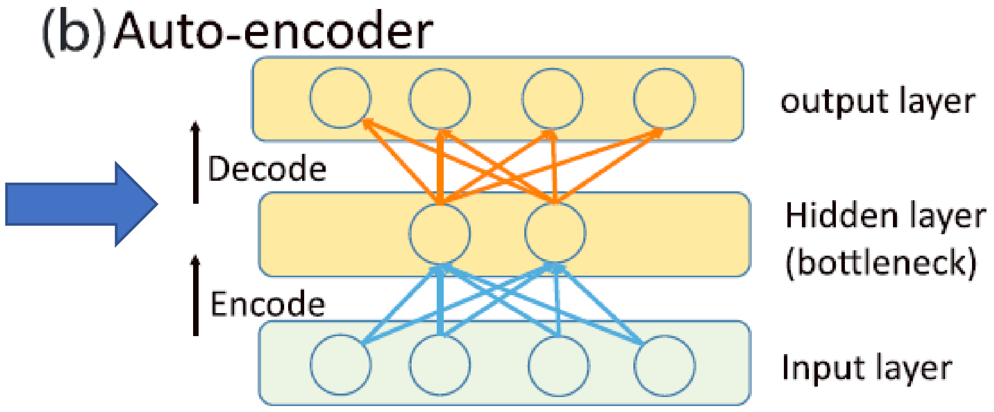
Three phases

1. Use ML to learn where the limit is.
2. Understand the gaps in our knowledge.
3. Using ML to unify across domains.

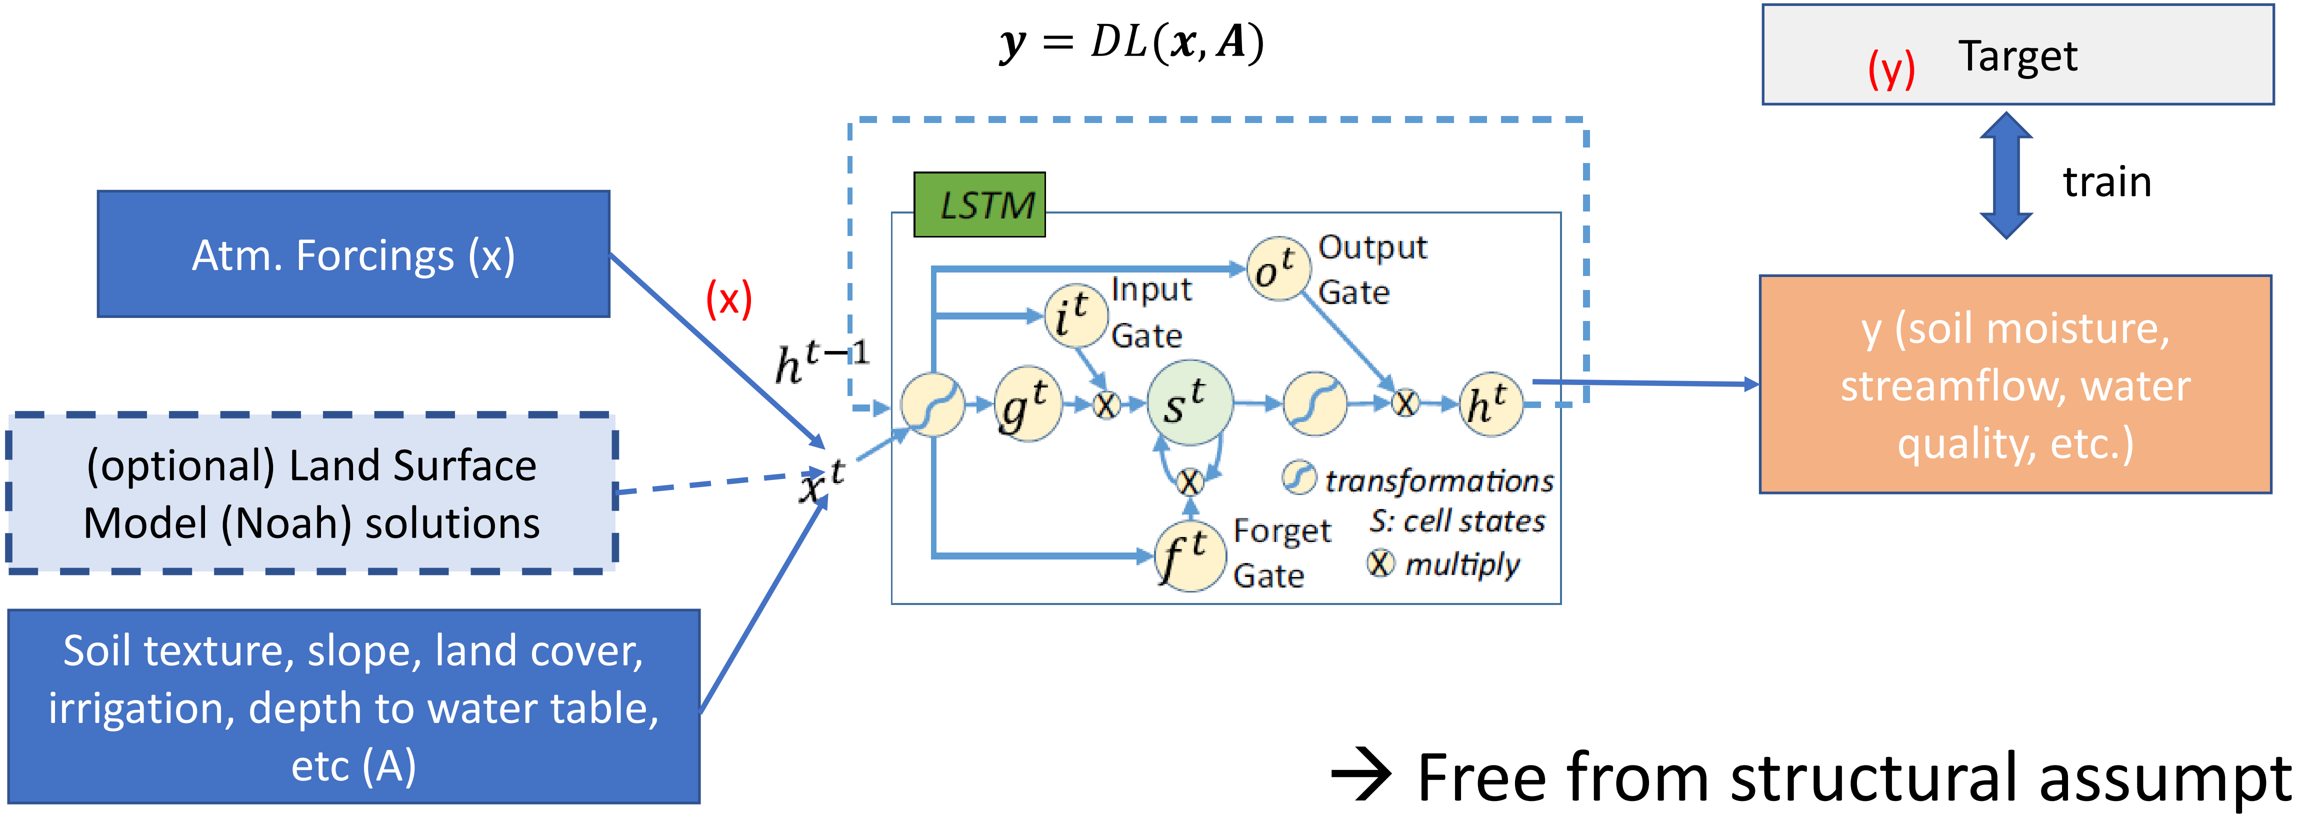


Some basic deep learning architectures





Hydrologic DL phase 1.
A hydrologic model w/o structural assumptions…



→ Free from structural assumptions

→ A chance to start anew!

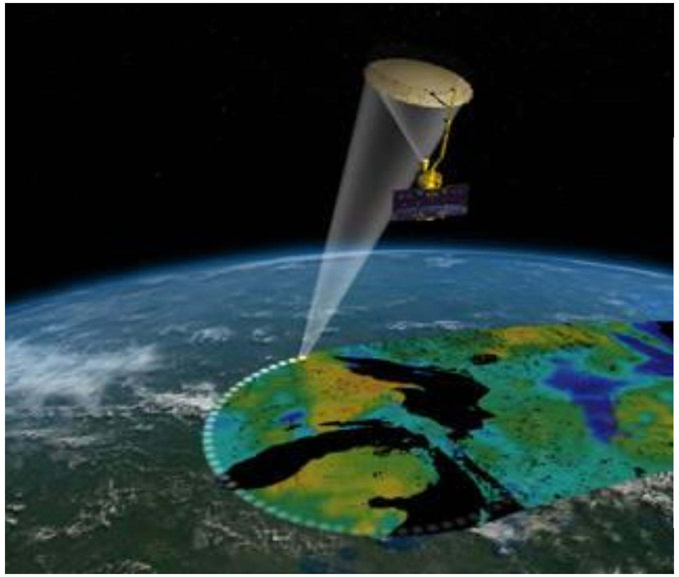
→ A chance to see where the limit is!

Case studies– first phase of DL in water

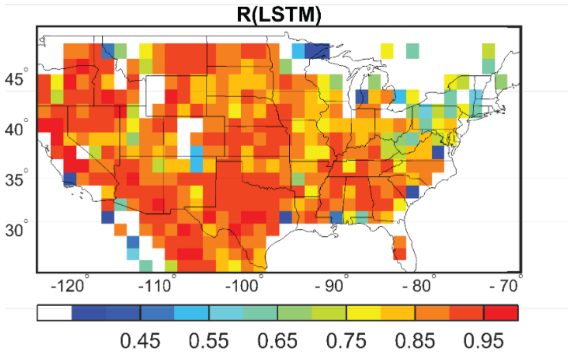
- Soil Moisture Active Passive (SMAP)
  - Launched recently (2015/04)
  - 2~3 days revisit time
  - Senses moisture-dependent top surface soil

- Streamflow modeling
  - Daily data
  - Accompanying attributes
  - With reservoirs, in data-sparse regions

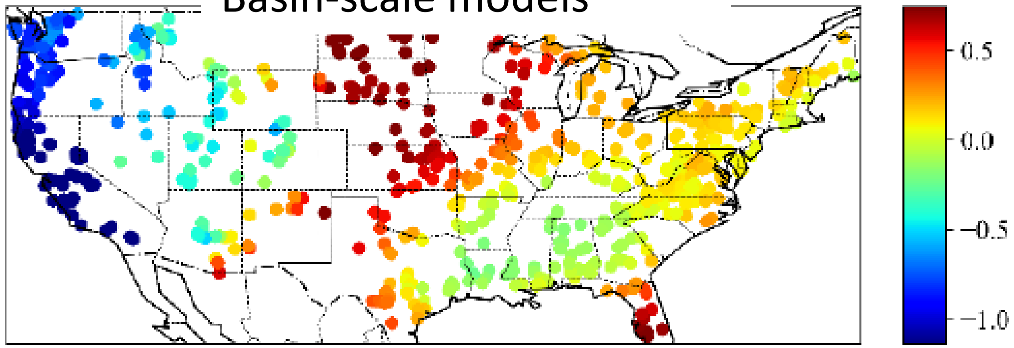
- Dissolved oxygen
- Water temperature
- Sediment
- Snow water equivalent



Gridded models



Basin-scale models



Long-term projections (first-phase of DL in hydrology)

- Examined comparison with in-situ data & long-term projections

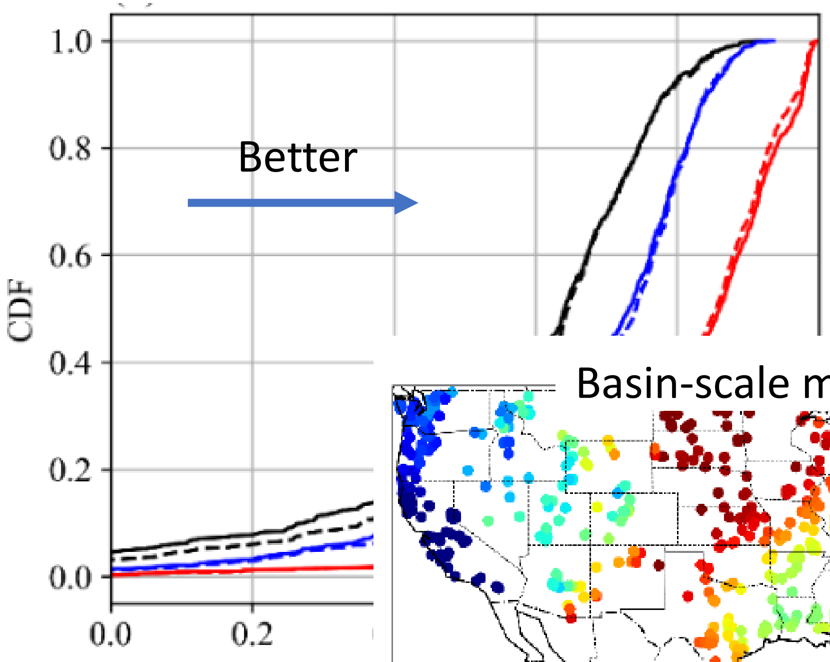
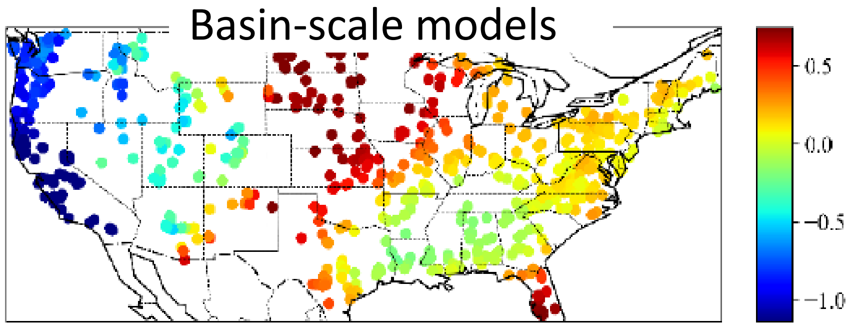
Fang et al., 2017

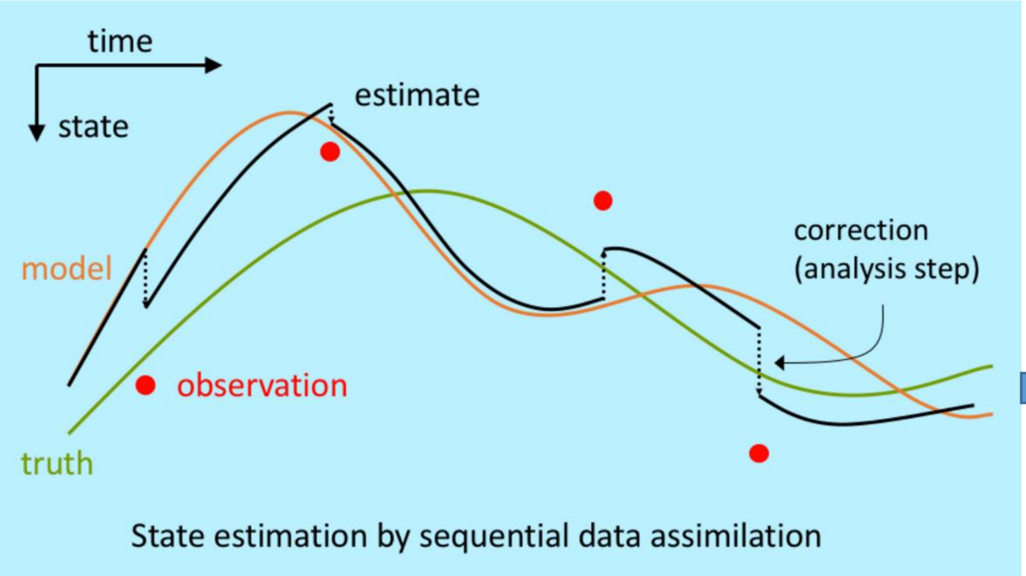




Shows us the information limit!

Short-term forecast

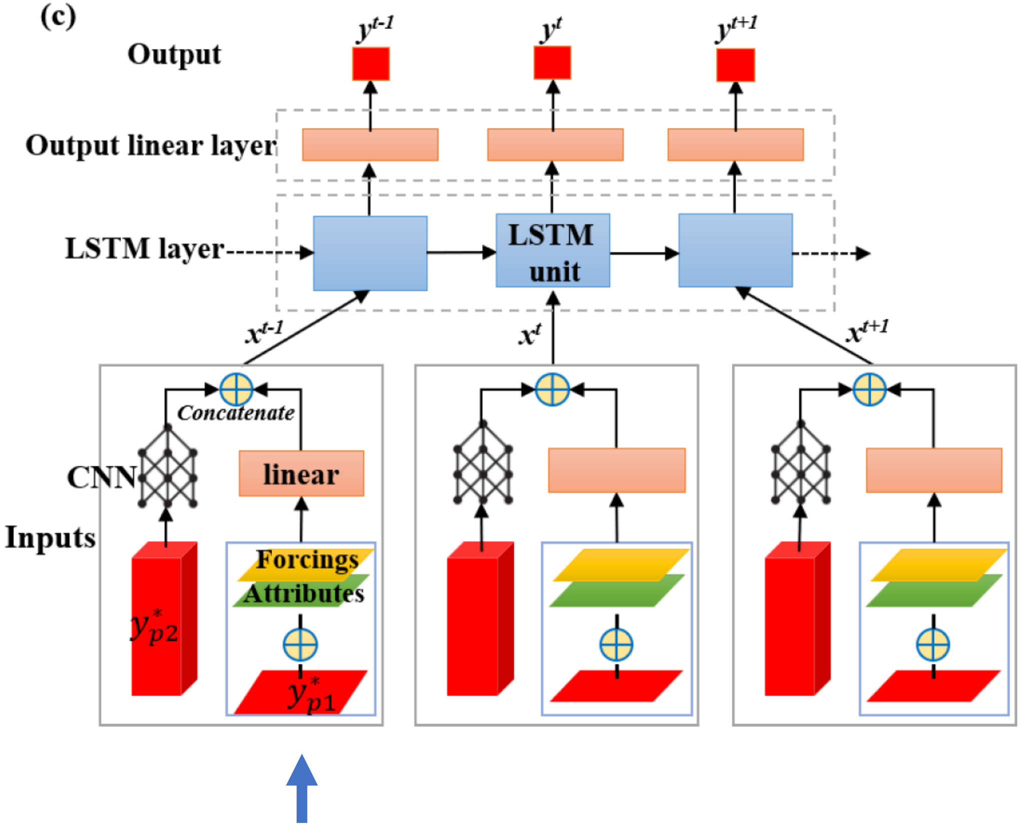
- Traditional "data assimilation" scheme



Simulation → Observation – (ENKF) → Correction

Choices: covariance matrix, what to include, how to solve, bias correction, etc.

Observation → Corrected Simulation



Q^{t-1}, Q^{t-2}, etc

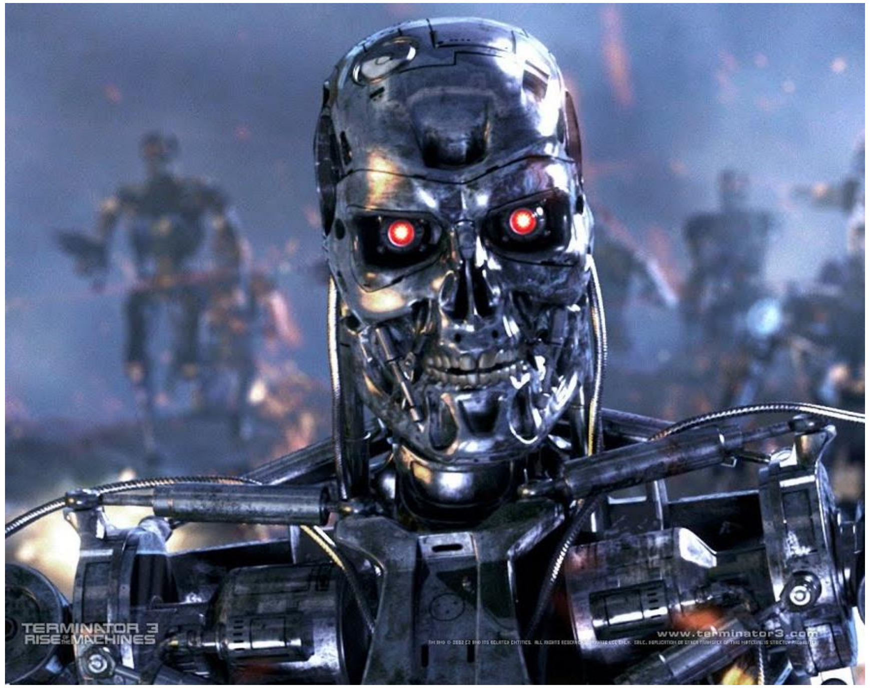
Water temperature



pure DL models

Human modelers

We need hybrids

Phase 2: How to surpass the teacher (training data)

Training data often have limitations:
Resolution, accuracy, time interval, availability (unobserved variables), geographical imbalance, not enough extremes, not capturing nonstationarity…

How to overcome such limitations?

- Inclusion of physics
- Learning about physics.

Similarity & Differences between deep learning (DL) and process-based models (PBM)?

This Photo by Unknown Author is licensed under CC BY-NC

Purely data-driven NNs	Purely process-based models
Similarities	
$y = g^W(u, x, A)$ $W = argmin(L(y, y^*))$	$y = f^\theta(u, x, A)$ $\theta = argmin(L(y, y^*))$

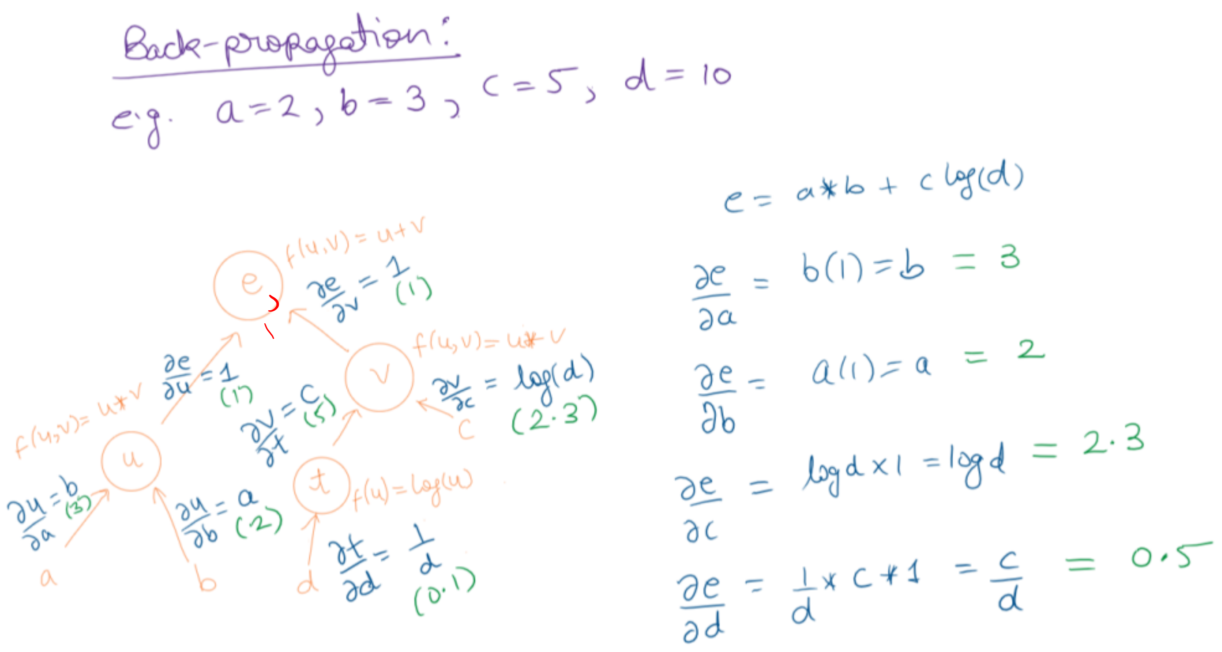
This Photo by Unknown Author is licensed under CC BY-SA

The secret? Differentiable programming!

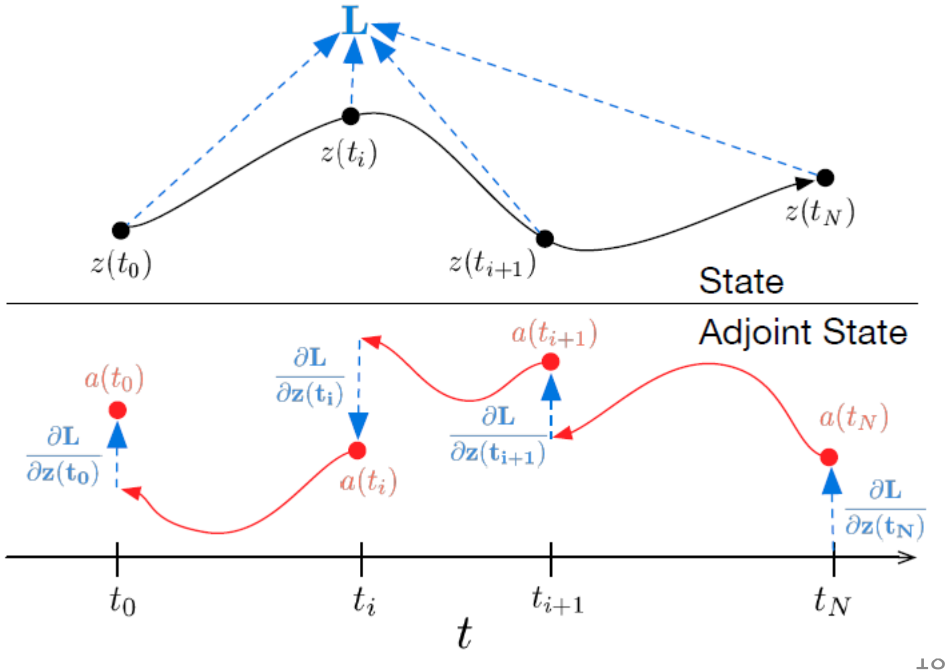
What does “Differentiable” mean?

- The ability to rapidly compute gradients $\frac{dL}{d\theta}$
- Enabling training by gradient descent

Automatic differentiation



Adjoint State method



Differentiable parameter learning

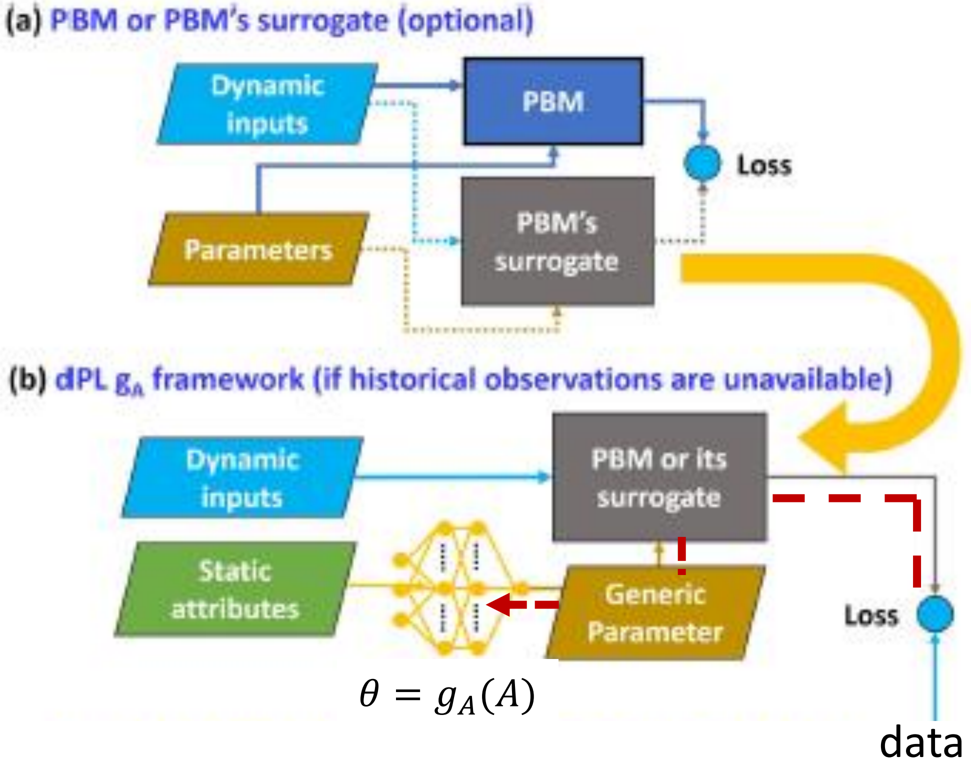
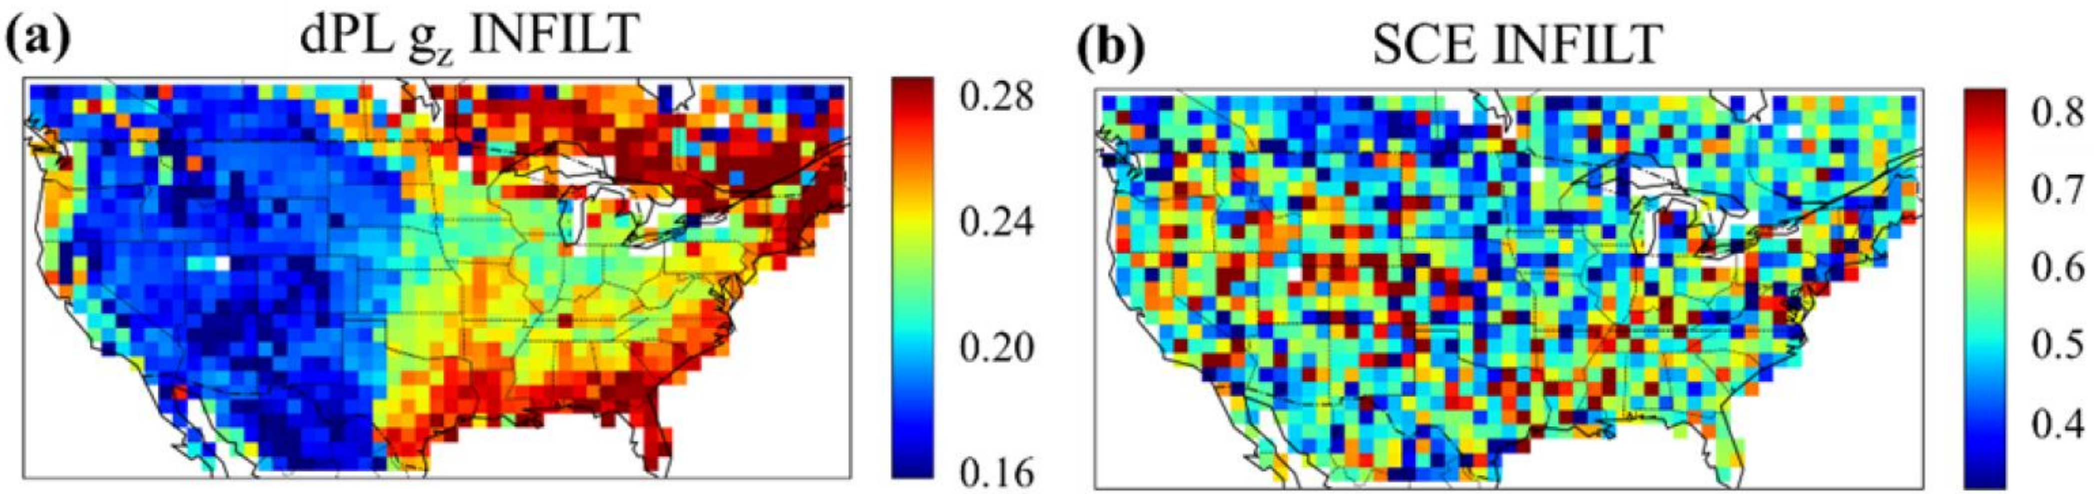
From calibration to parameter learning: Harnessing the scaling effects of big data in geoscientific modeling

Wen-Ping Tsai[1], Dapeng Feng[1], Ming Pan[2,3], Hylke Beck[4], Kathryn Lawson[1,5], Yuan Yang[6,7], Jiangtao Liu[1] & Chaopeng Shen[1,5]✉





Point #1. Data scaling relationships (network effect?)

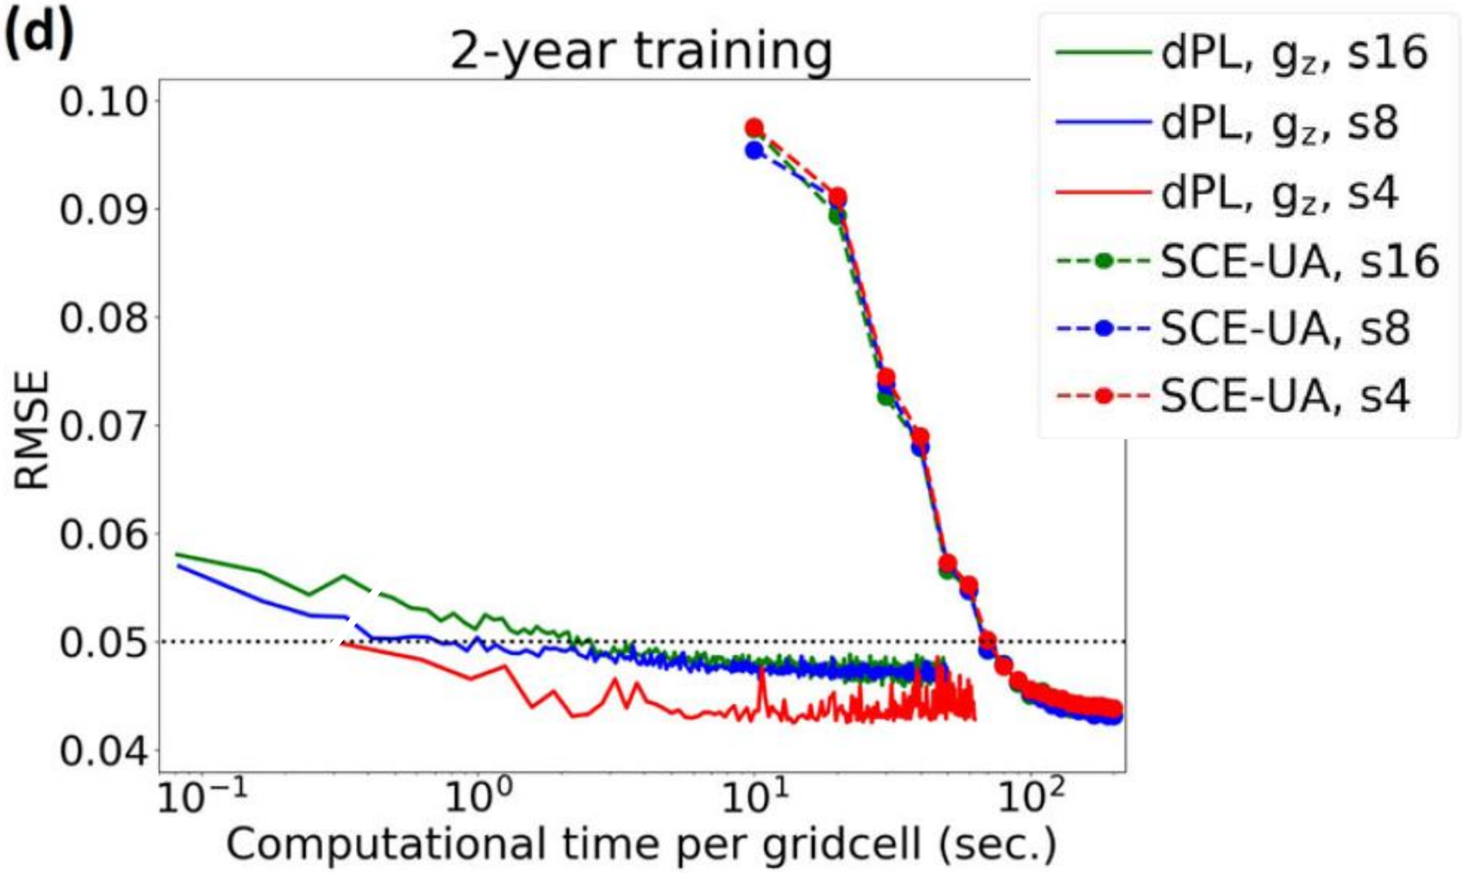
1. dPL = SCEUA for lowest RMSE

2. dPL scales better with more data

3. Orders of magnitude more efficient

4. (not shown) better results for **untrained** variables and better **spatial generalization** than traditional approach!

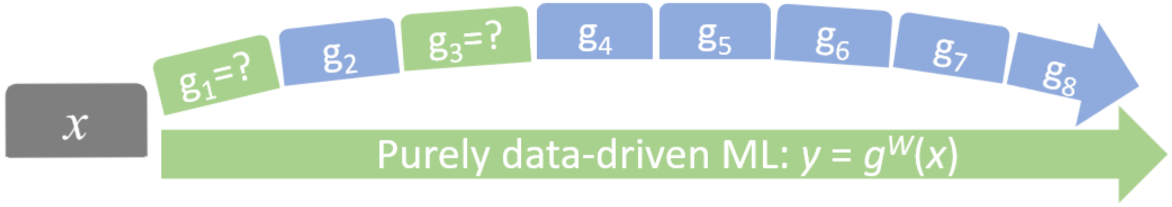
Relies on differentiable programming!



Tsai et al. 2021, Nature Communications

What is Differentiable Modeling (DM) in Geosciences?

DM



- NNs mixed w/ process-based equations (priors)
- The priors constrain the learning to an interpretable scope.
- intermediate physical variables.
- Update our knowledge and learn unrecognized relationships from data.

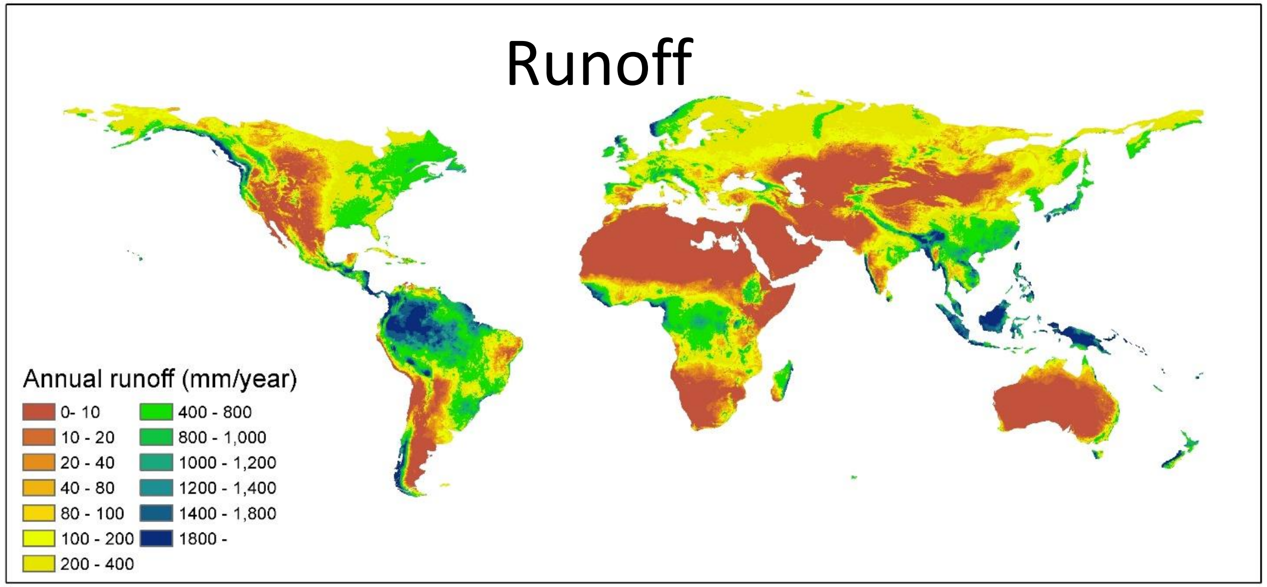
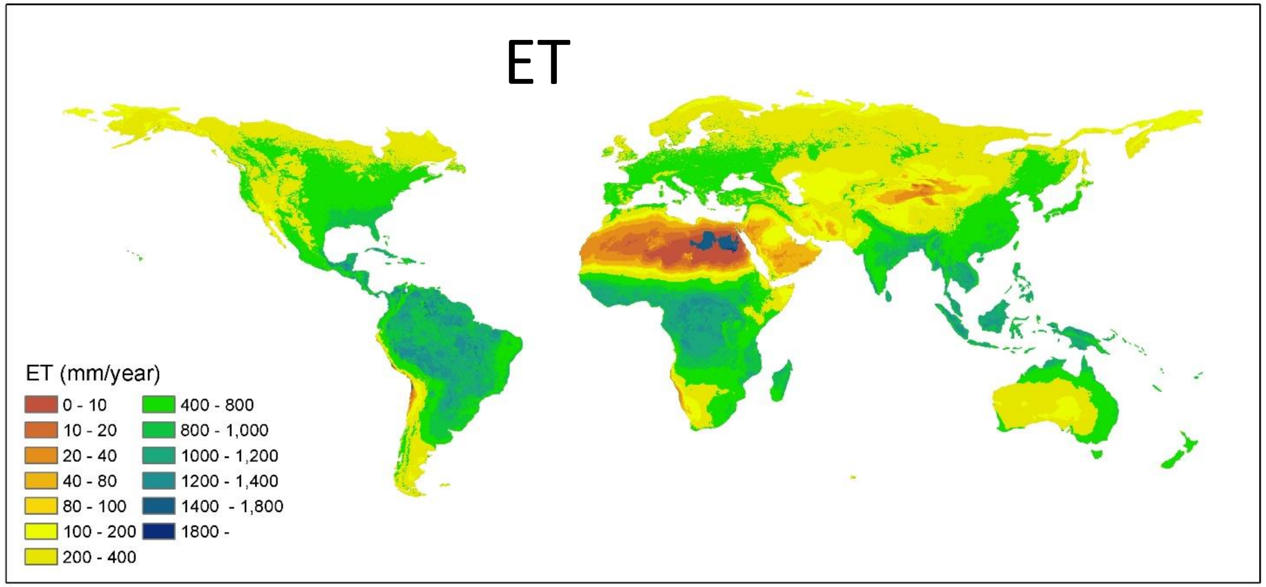
What can DM bring to global hydrology?

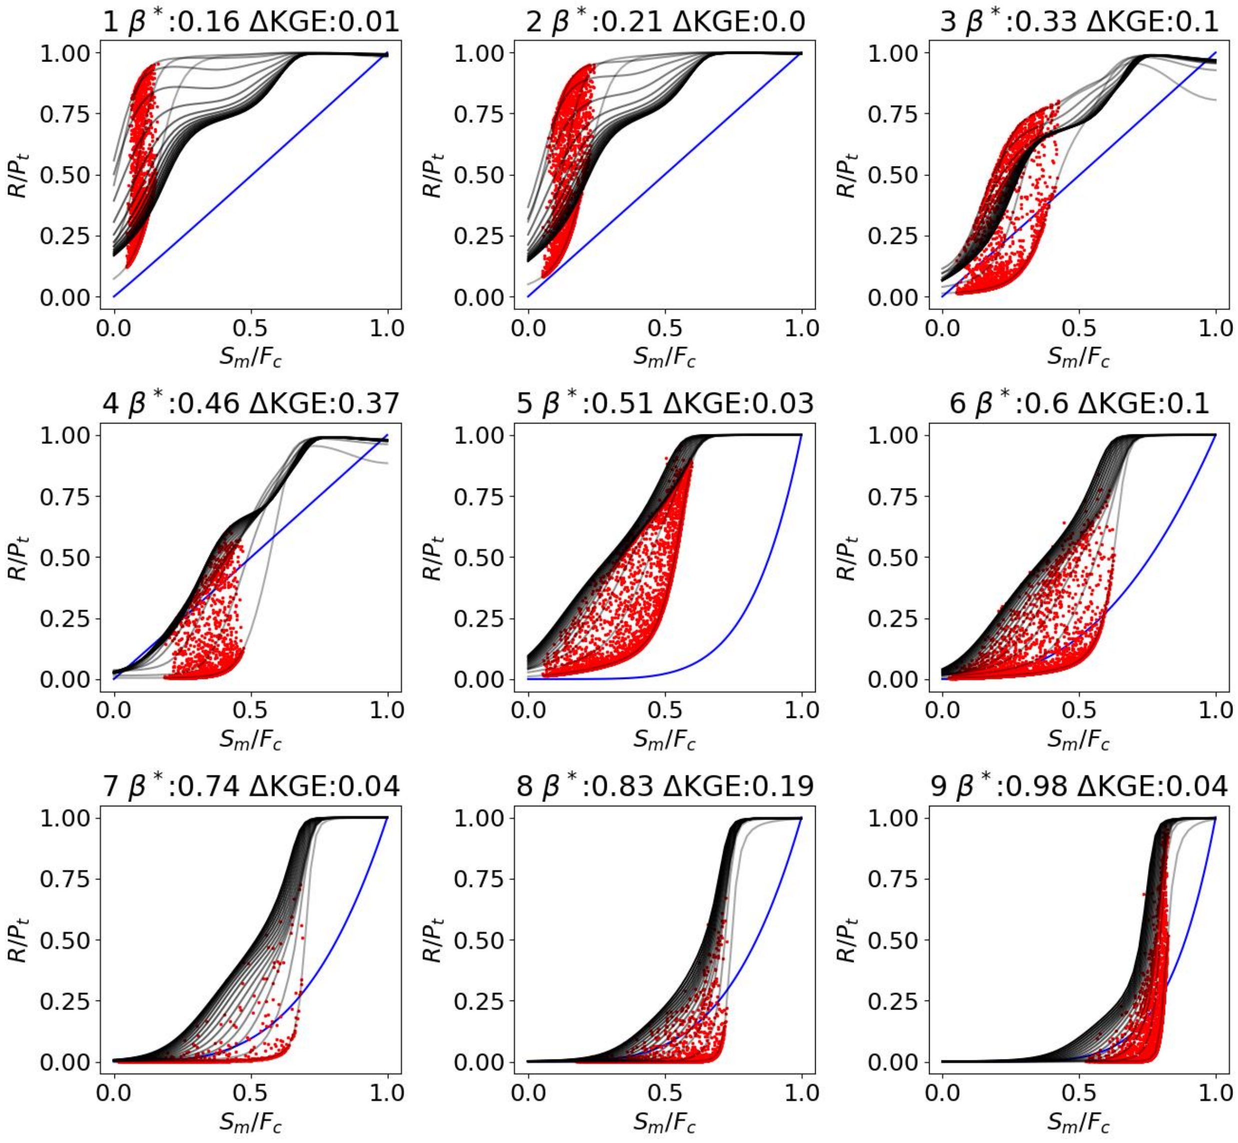
- Spatial extrapolation in data-sparse regions
- Extremes
- Learn robust unknown functions
- Human dynamics or unknown physcs
- Correct forcings

Produced by differentiable models





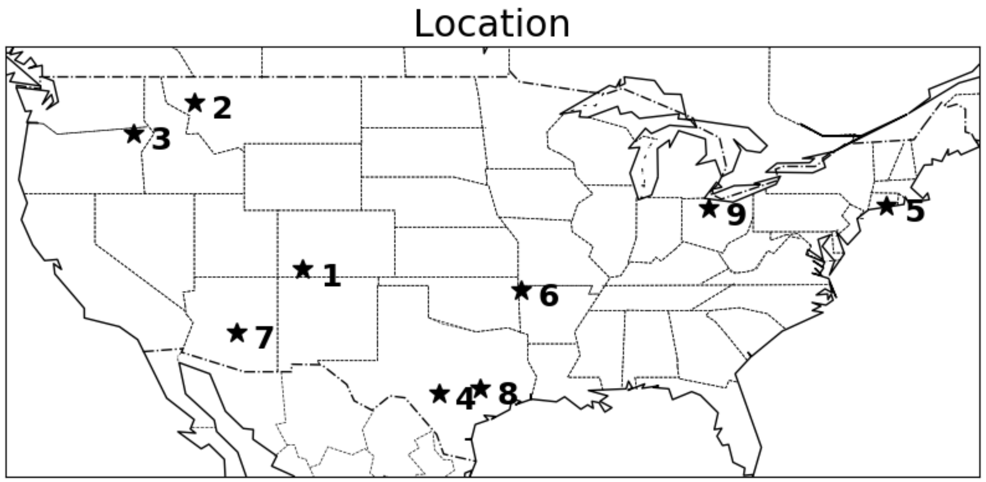
Learning unknown relationships from data (in preparation)



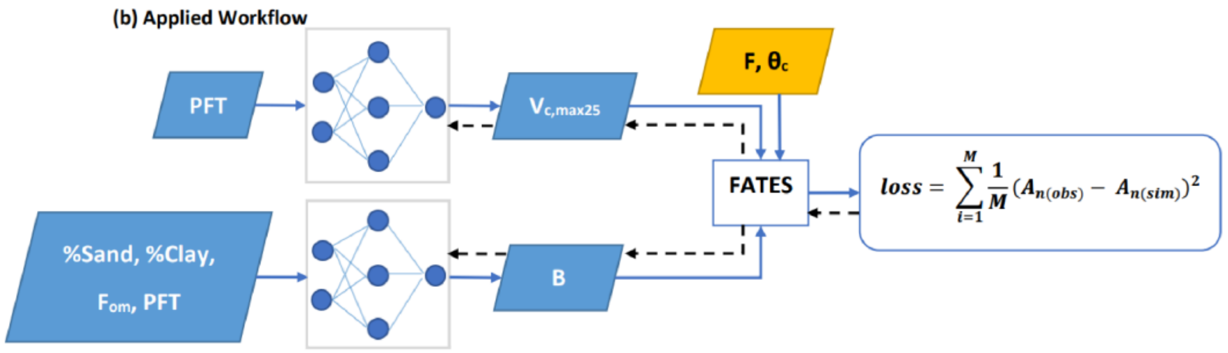
$$R/P_t = (S_m/F_c)^{\beta}$$

$$\boxed{R/P_t = ANN(\beta^*, F_c, S_m, S_m/F_c, P_t)}$$

Blue line: original power law relation
Red dots: ANN simulations
Black lines: continuous plotting of ANN functions



Example 4. Ecosystem modeling: photosynthesis



(a) Temporal holdout test for the following system

Runs	Corr		RMSE (μmol m^{-2} s^{-1})		Bias (μmol m^{-2} s^{-1})		NSE	
	Train	Test	Train	Test	Train	Test	Train	Test
V_{def}+B_{def}	0.565		6.780		1.476		0.041	
V_{def}+B_{def} **	0.592		5.488		1.034		0.318	
V_{def}+B	0.678	0.547	5.887	6.730	1.353	1.754	0.321	-0.084
V+B_{def}	0.769	0.593	4.595	5.677	-0.129	-1.368	0.587	0.229
V+B	0.800	0.748	4.299	4.421	0.037	0.347	0.638	0.532
V+B **	0.774	0.768	4.269	4.198	0.056	0.092	0.597	0.581

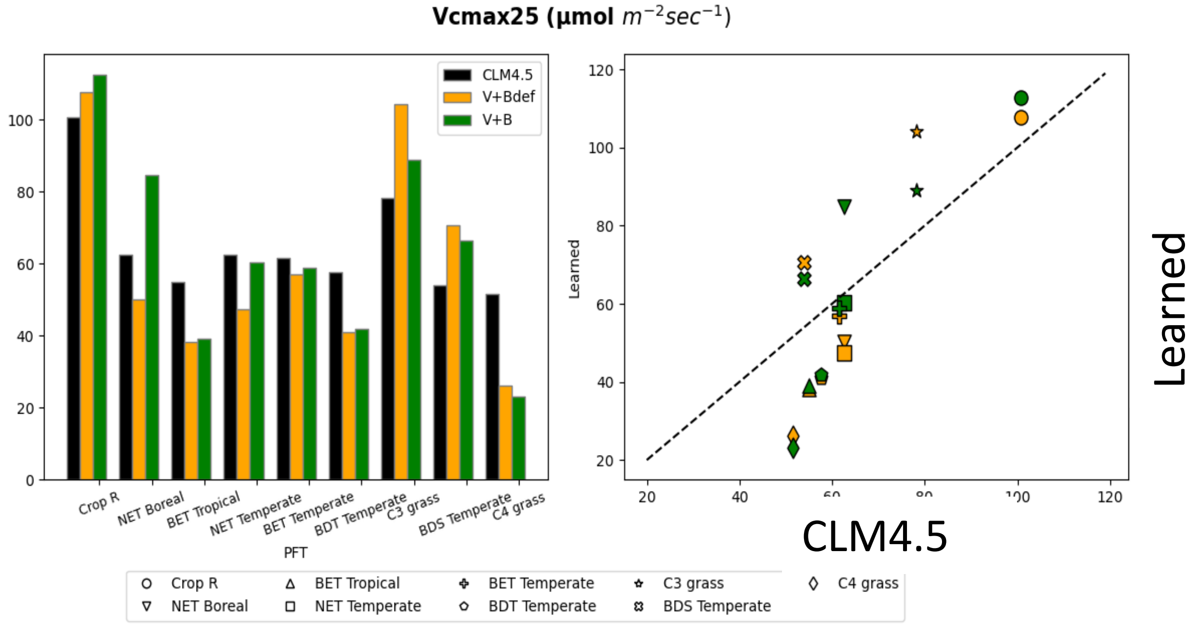
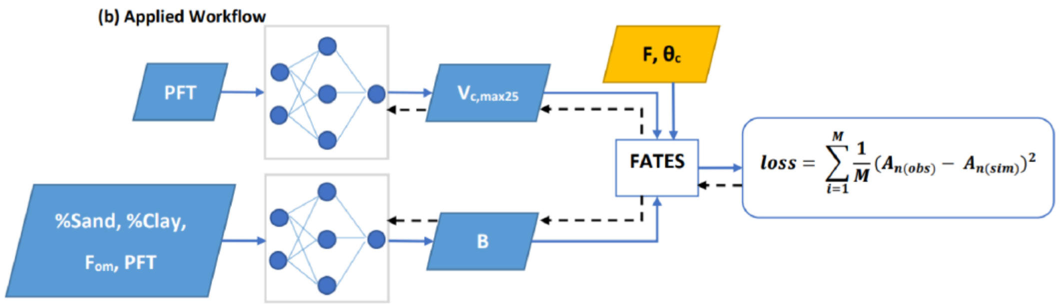
A differentiable, physics-informed ecosystem modeling and learning framework for large-scale inverse problems: demonstration with photosynthesis simulations

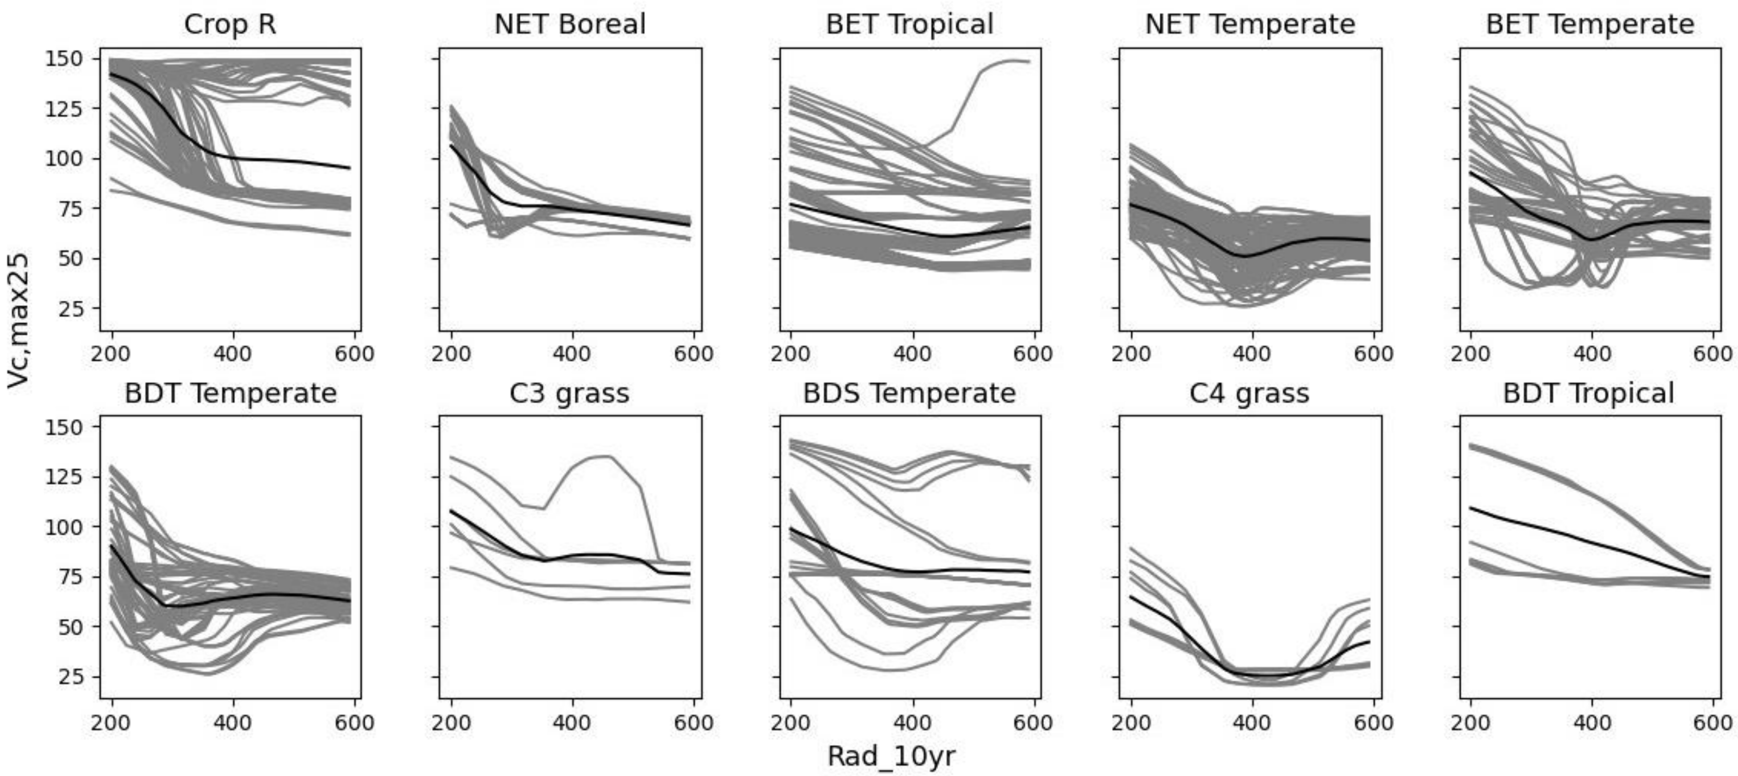
Doaa Aboelyazeed[1], Chonggang Xu[2], Forrest M. Hoffman[3,4], Jiangtao Liu[1], Alex W. Jones[5], Chris Rackauckas[6],



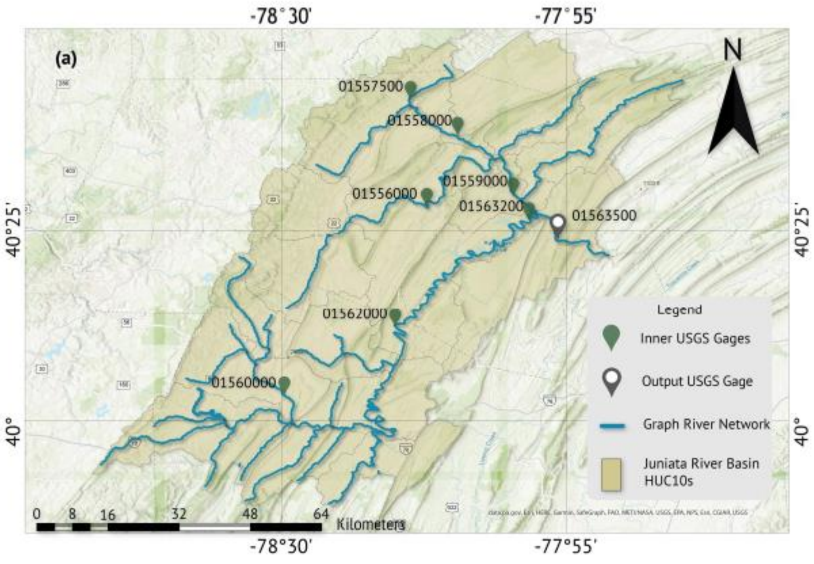
Example 4. *Ecosystem modeling: photosynthesis*



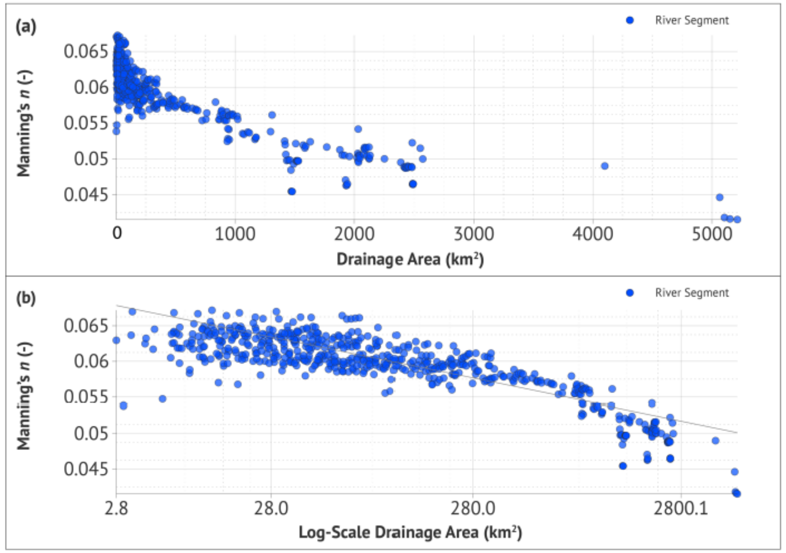
Discovering environmental dependencies of previously PFT-dependent parameter

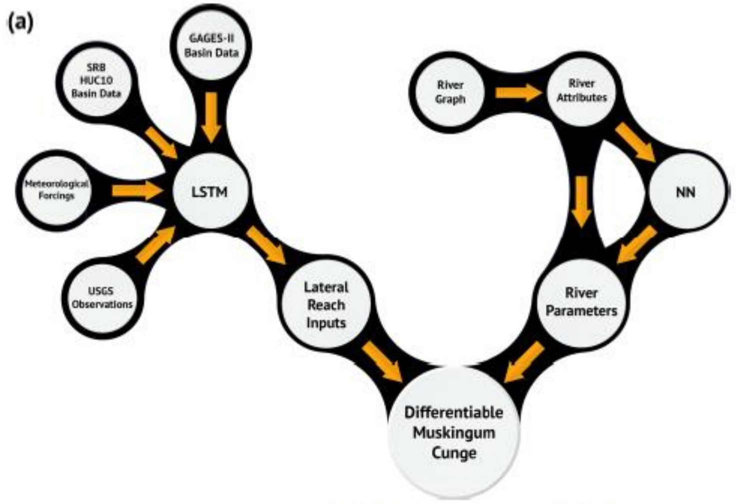


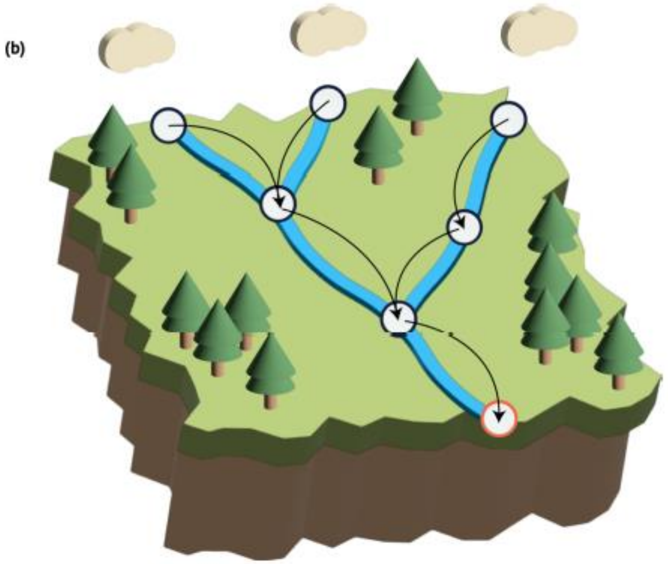
Example 4. *Differentiable routing model*



MLP *n* Distribution Trained Against Observed Discharge

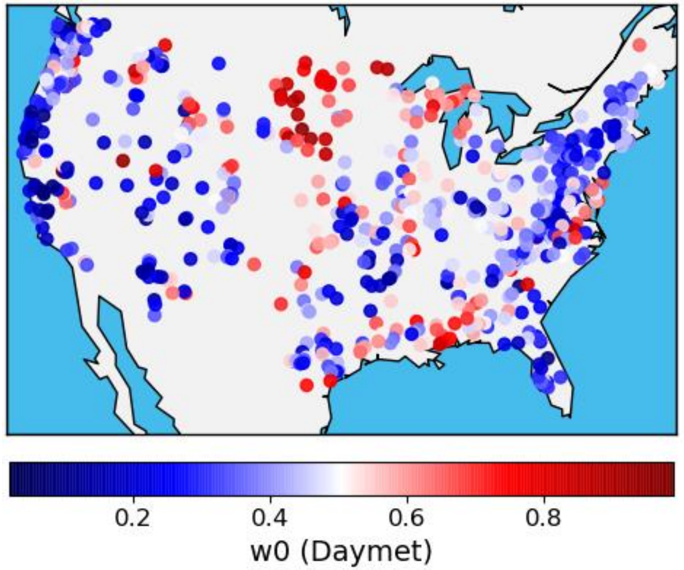


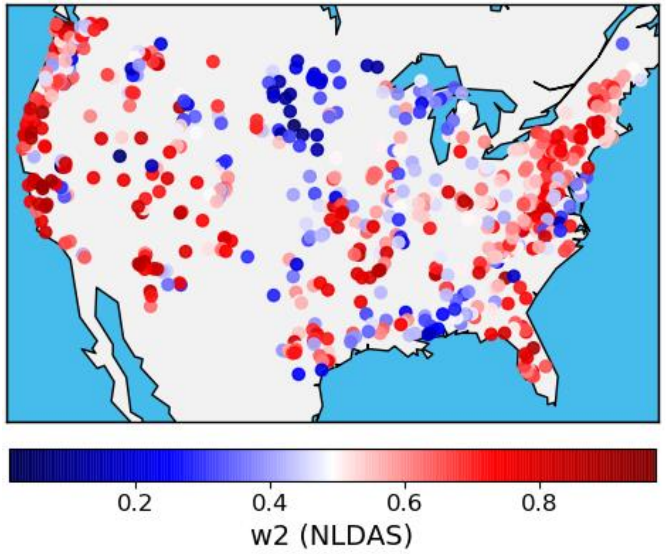


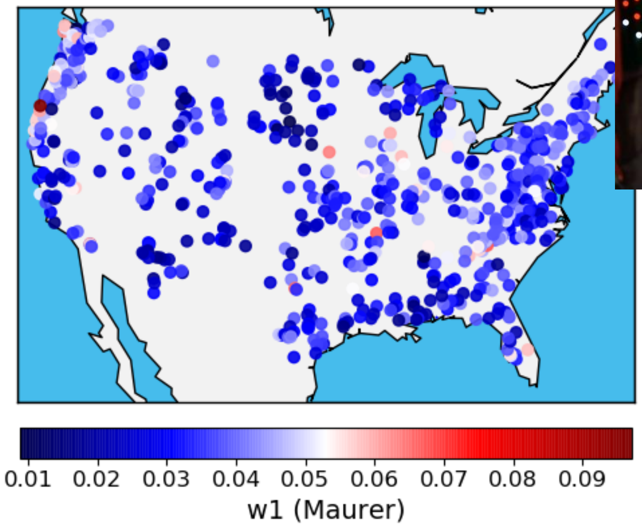


Example 6. Fusion of forcings (in preparation)

NLDAS (0.56) > Daymet (0.41) > Maurer (0.03)

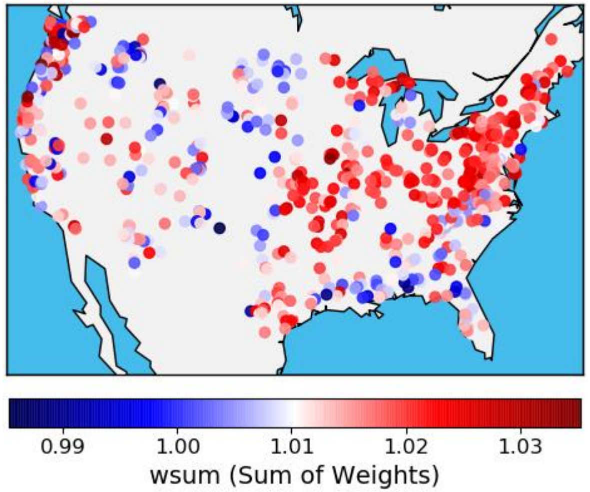






Simulation	Forcings	Median NSE	Median KGE	Low flow RMSE (mm/day)	High Flow RMSE (mm/day)
Single forcing w/o bias corr	Daymet	0.737	0.728	0.134	3.990
Multiforcing with bias correction	Daymet, Maurer, NLDAS	**0.770**	**0.780**	**0.082**	**3.414**

Low bias



Future

- All kinds of models will be differentiable
- Climate change impact assessment will be done using high-quality models that have absorbed big data
- Many theories will be rewritten
- WaterGPT?
