# User Needs for Decision-Relevant Climate Data

**Decision-relevant climate data** is essential for mitigation and adaptation planning across a variety of regions and sectors. However, this data also needs to be:

- **Salient:** Localized to regions of interest for stakeholders and decision-makers. Including variables of relevance for a given application.
- **Credible:** Historically validated, capturing relevant processes and right for the right reasons.
- **Authoritative:** Backed by independent experts.
- **Accessible:** Ready for use.

# What is Downscaling?

Many different **global climate model (GCM)** simulations have been conducted as part of the **Coordinated Model Intercomparison Project (CMIP)**.

These cover both historical periods (what was possible) and future periods (what will be possible).

However, CMIP GCM data is typically too coarse for decision-makers, who are interested in **resolving local scales** (individual mountain peaks, towns, valleys and coastlines) and **assessing local impacts** (e.g., extreme weather, renewable energy production).

**Downscaling techniques** allow GCM output to be **enhanced to decision-relevant scales**, making it relevant on local scales and for understanding scale-sensitive phenomena.

# Types of Decision-Relevant Data Products

**Statistically Downscaled Products (SDPs):** Data products based on empirical and algorithmic relationships between coarse and fine scales, generally derived from observations (e.g., LOCA2, STAR-ESDM).

**Dynamically Downscaled Products (DDPs):** Data produced by regional climate models forced by coarse-resolution climate model inputs or reanalysis data.

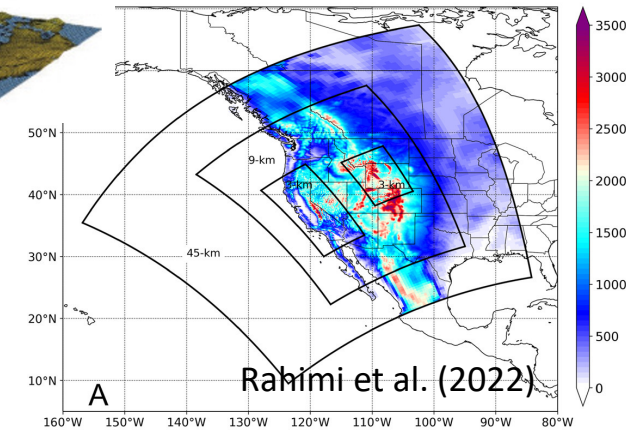

**Regionally-Refined Models (RRMs):** Data produced using global climate models with nested or refined grids over a region of interest (e.g., DOE's E3SM).

**Artificial Intelligence / Machine Learning (AI/ML):** Cutting-edge and exploratory techniques for downscaling using data-driven methods.

*Left: A basic technique used for statistical downscaling.*

*Right: Nested dynamical downscaling domains used in recent work by UCLA.*

*Left: A regionally-refined E3SM mesh used by the DOE HyperFACETS project to develop a high-resolution ensemble for the CONUS.*

# Many New Climate Data Products over CONUS

Statistically Downscaled Products	Grid Spacing	Years
Localized Analogues v2 (LOCA2)	6km / 3km Calif.	1950-2100 (multiple)
Seasonal Trends and Analysis of Residuals (STAR) Empirical-Statistical Downscaling Model (ESDM)	4km	1950-2100 (multiple)
Multivariate		(multiple)
<b>Which data should we use?</b>		
Dynamically		
Argonne Dyn		0 future (x3 models)
IM3/HyperFACETS TGW Ensemble	12km	40 hist + 40 PGW (x8 scenarios)
PNNL Western US Product	6km	42 hist + 30 PGW (x5 ensemble)
Western U.S. Dynamically Downscaled Dataset	9km and 3km	40 hist + 85 SSP370 (x9 ensemble)
NCAR CONUS1 Product	4km	13 hist + 13 RCP8.5
NCAR CONUS2 Product	4km	21 hist + 21 RCP8.5
NCAR CONUS404 Product	4km	42 hist + 44 SSP370

# State of the Science

- Only **statistically and dynamically downscaled** products available for operational use
- **Statistical products** are the most mature
  - Most ensemble members
  - Multiple future trajectories
  - Generally available at ~5km grid spacing
- However, statistical methods are trained on historical data
  - Some evidence they **may underestimate future precipitation extremes**
- Statistical methods also (largely) only offer daily temperature and precipitation data
  - Some exceptions (e.g., NEX-GDDP at 25km using satellite training)
- Work is underway to develop bias-corrected dynamically downscaled products for operational use
  - Most promising at present is ClimRR product (Argonne National Lab) at ~12km grid spacing
  - For the Northeastern United States, work by Muge Komurcu (NASA)  
<https://doi.org/10.1029/2018EA000426>

# *Why Do Users Choose Particular Data Products?*

Selection of climate data products often occurs via:

- Word-of-mouth
- Existing collaborations
- Agency affiliation
- Government mandate
- Use elsewhere
- Highest resolution available
- It's what's available

A better basis for selection:

- Comprehensively validated and evaluated
- Complete documentation
- Methodology supported by experts

**Consideration of multiple data products is generally recommended for decision-making, but incompatibilities and inconsistencies means multiple products are rarely used in practice.**

# Evaluation of LOCA2 and STAR-ESDM

99.9th Percentile Precipitation Relative Difference (%)

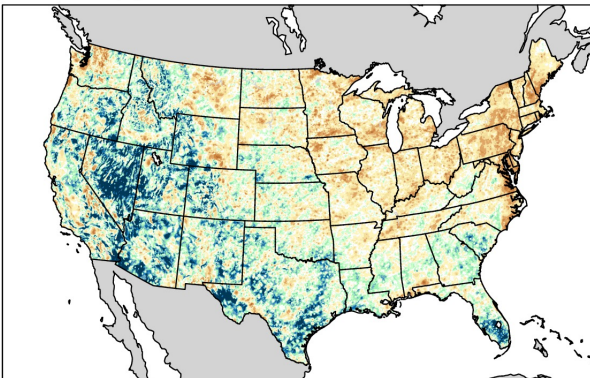

(a) NClimGrid minus PRISM

(b) Livneh minus PRISM

(c) STAR-ESDM minus PRISM

(d) LOCA2 minus PRISM

# ATLAS

## of the 5th National Climate Assessment

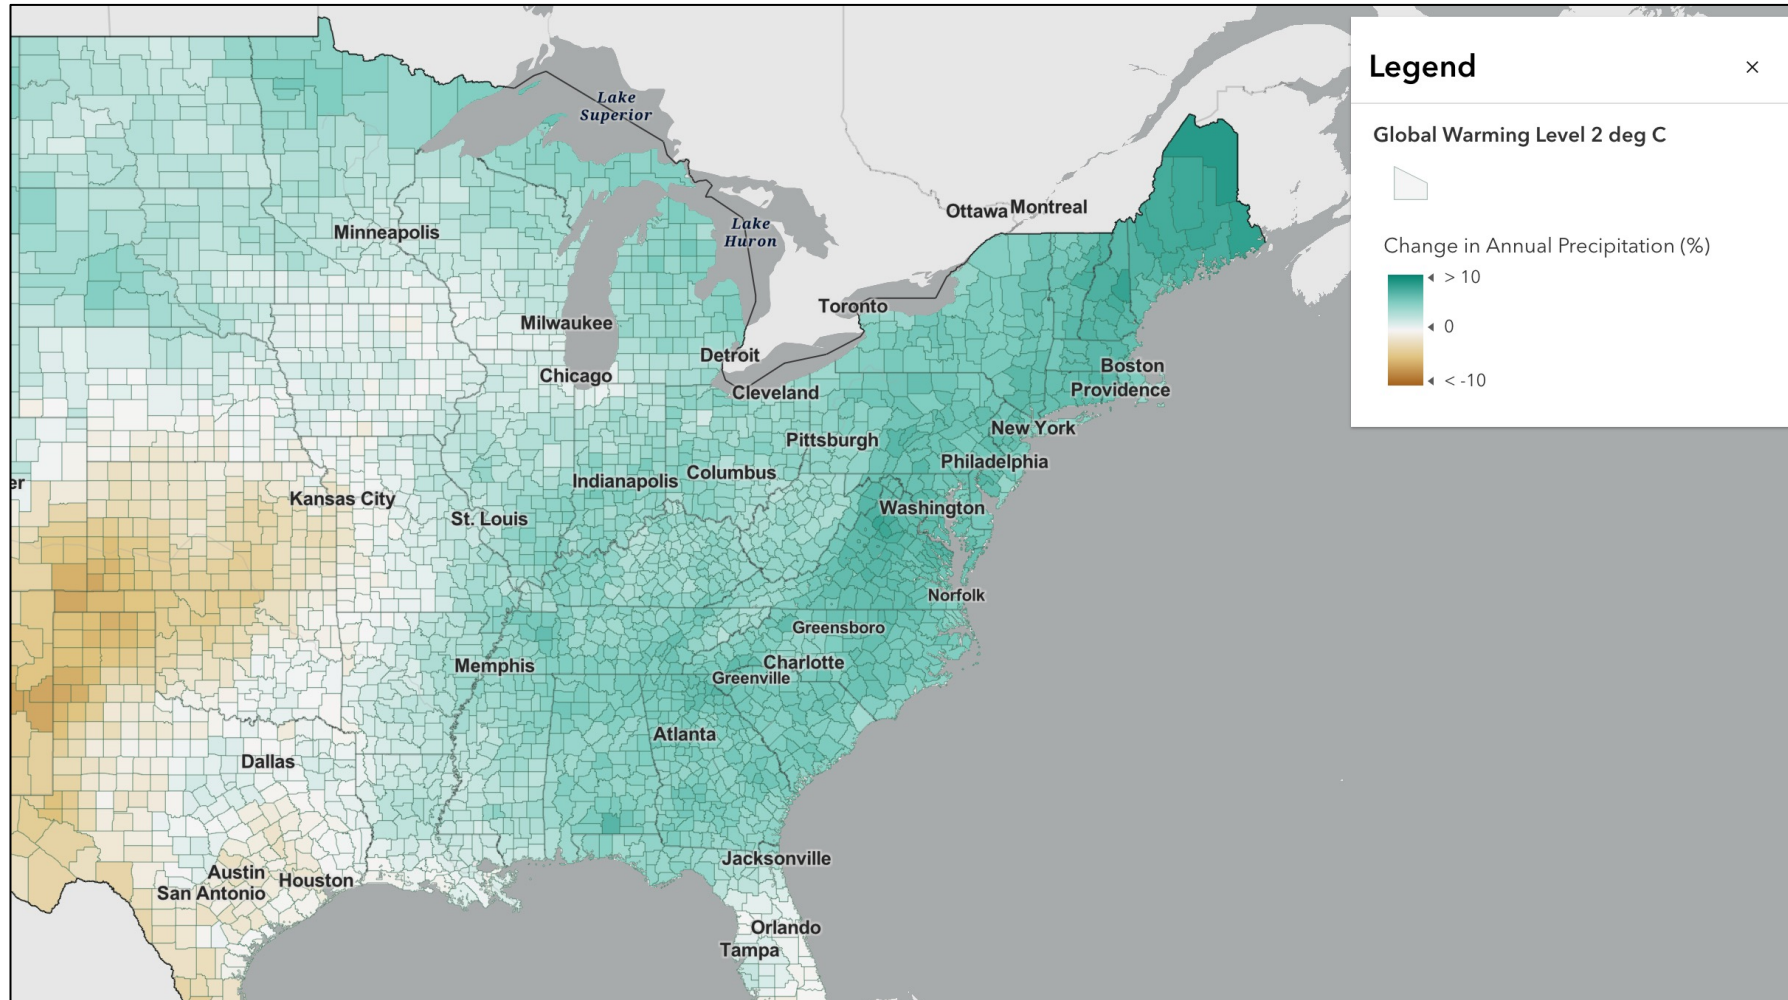

To help Americans anticipate how changing climate conditions might affect their homes and businesses, the United States Global Change Research Program conducts a comprehensive review of scientific information on climate trends and impacts in our country every four years. The 5th National Climate Assessment – often referred to as NCA5 – was published in 2023.

This site taps into the power of maps and stories to share information from NCA5.

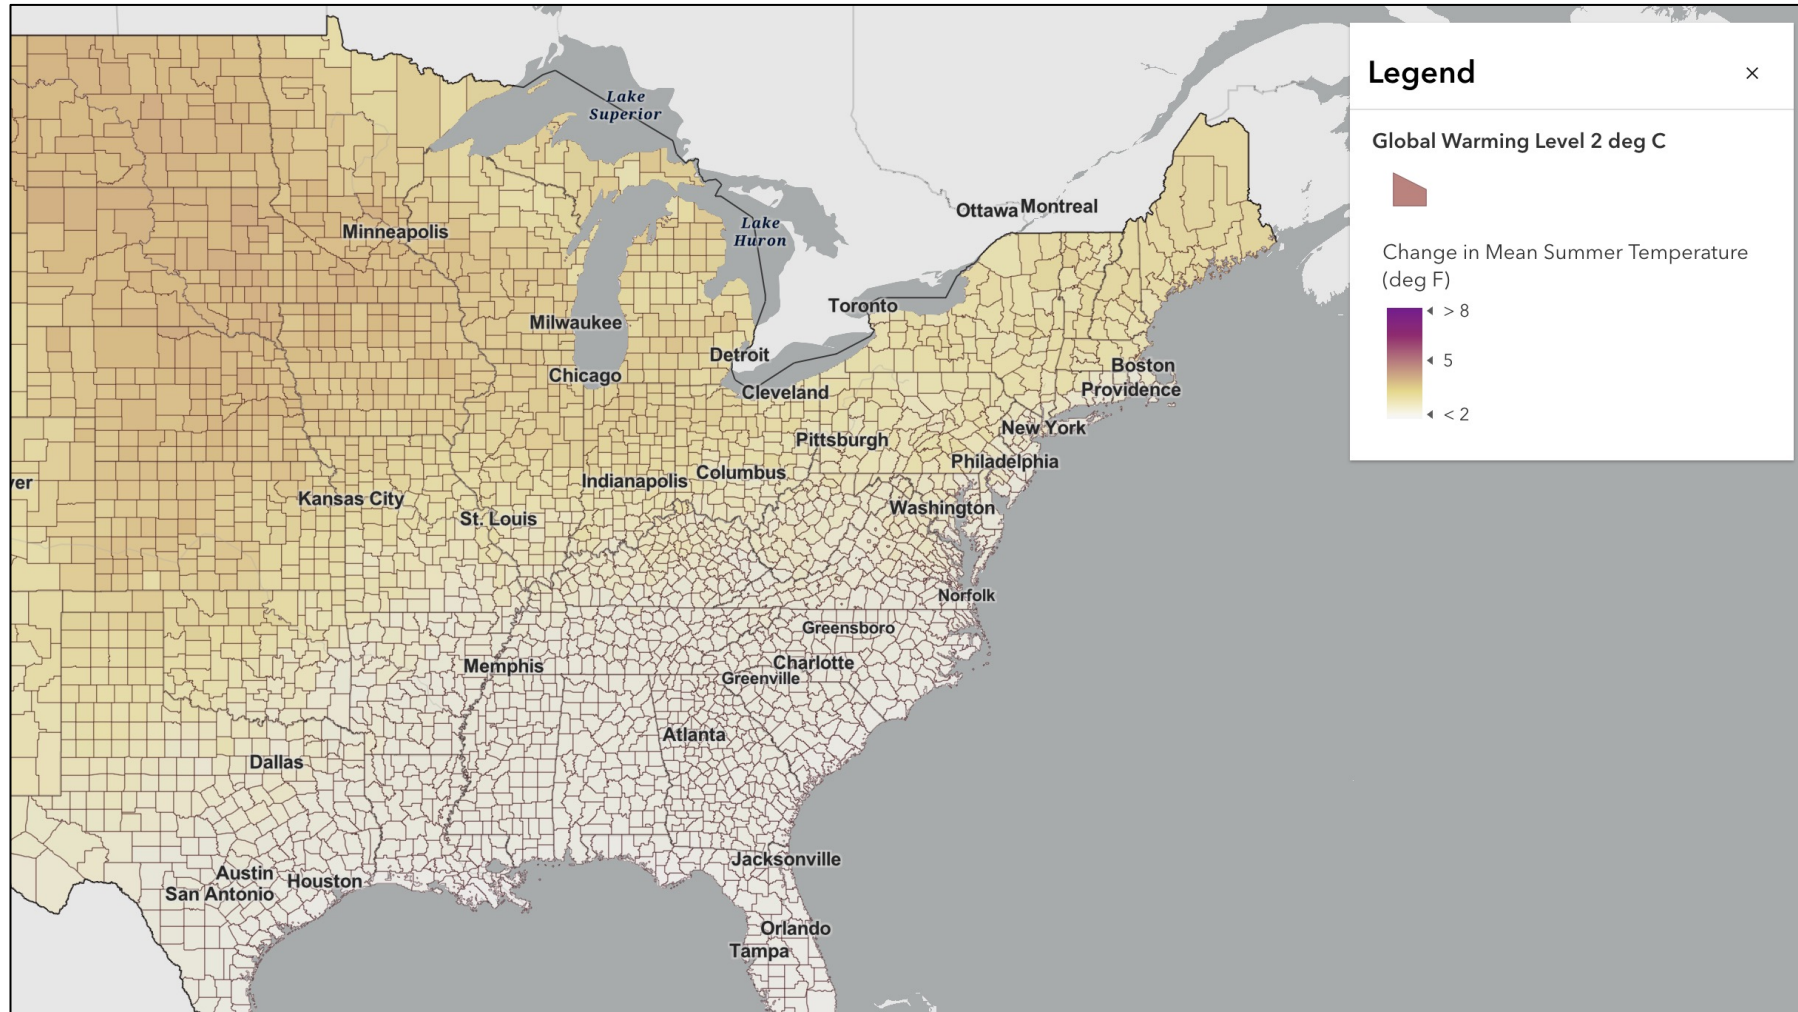

# Global Warming Levels

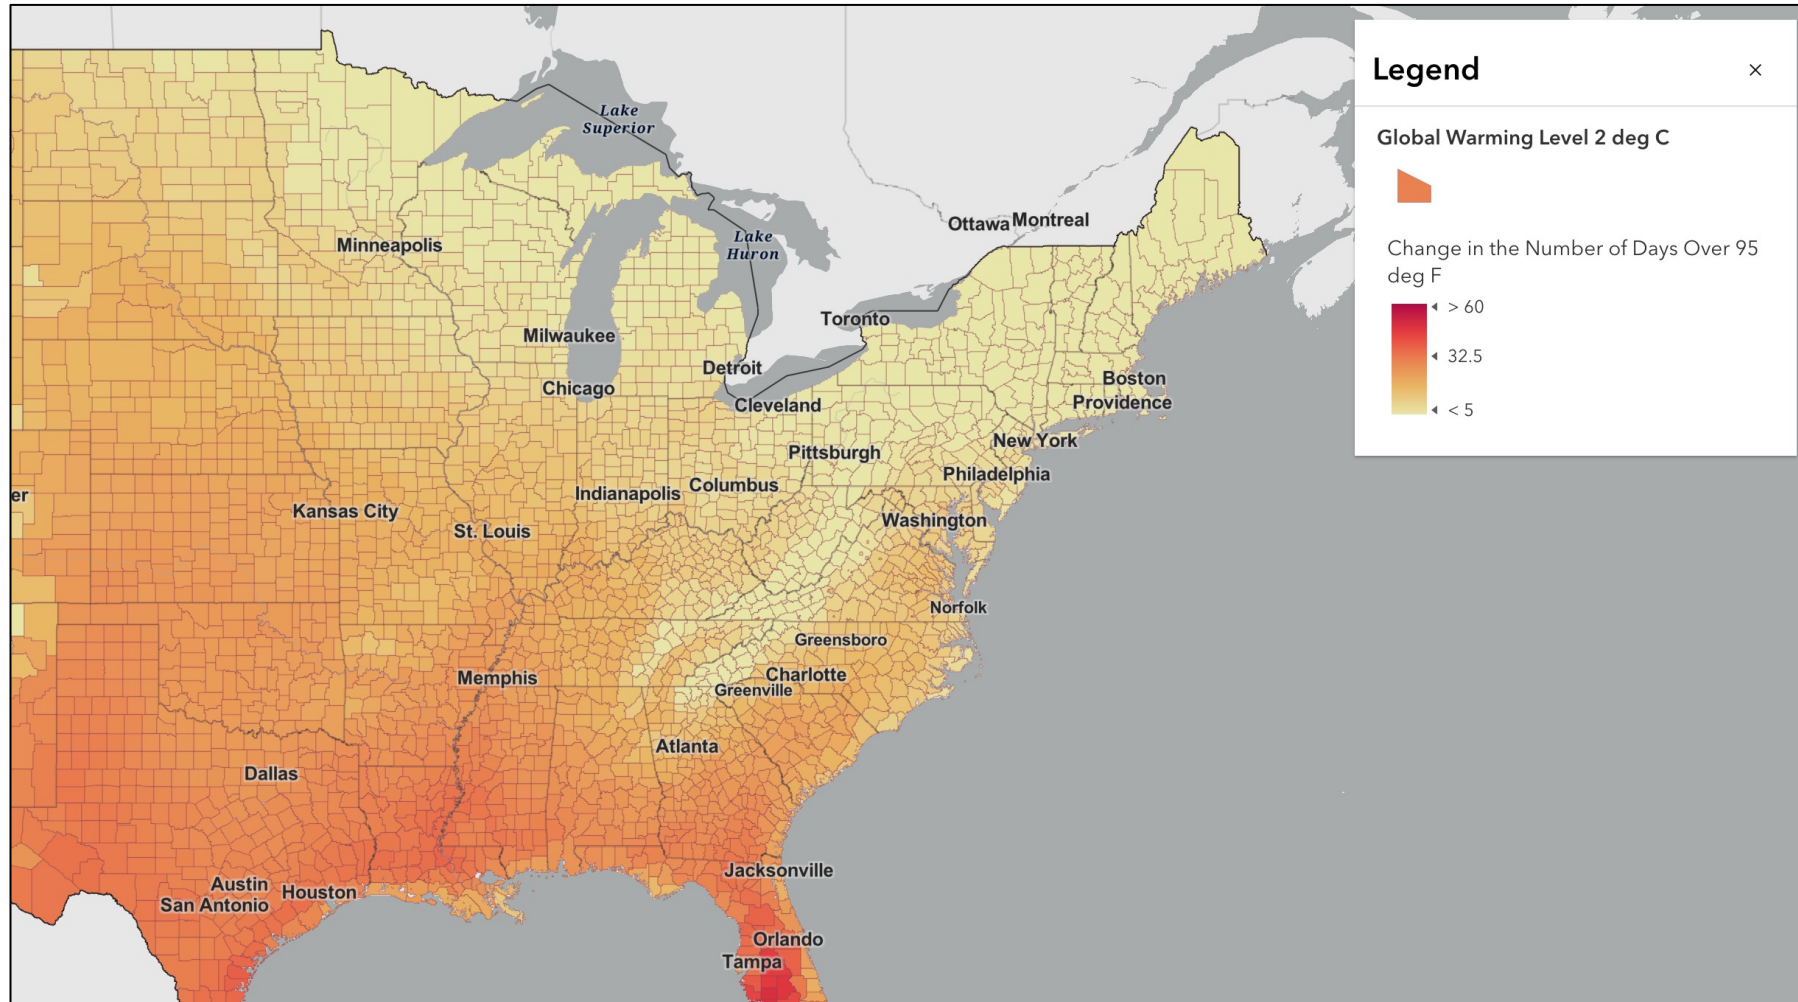

# Change in Annual Precipitation (2°C WL)

# Change in Mean Surface Temperature (2°C WL)

# Change in Number of Days Above 95F (2°C WL)

# ***Understanding Decision-Relevant Regional Climate Data Products Workshop***

November 14-16, 2023 in Berkeley, California

A meeting of scientists from DOE/PCMDI and DOD/SERDP, together with researchers, data producers, end-users and agency representatives to understand the state of the nation's decision-relevant regional climate datasets and projections.

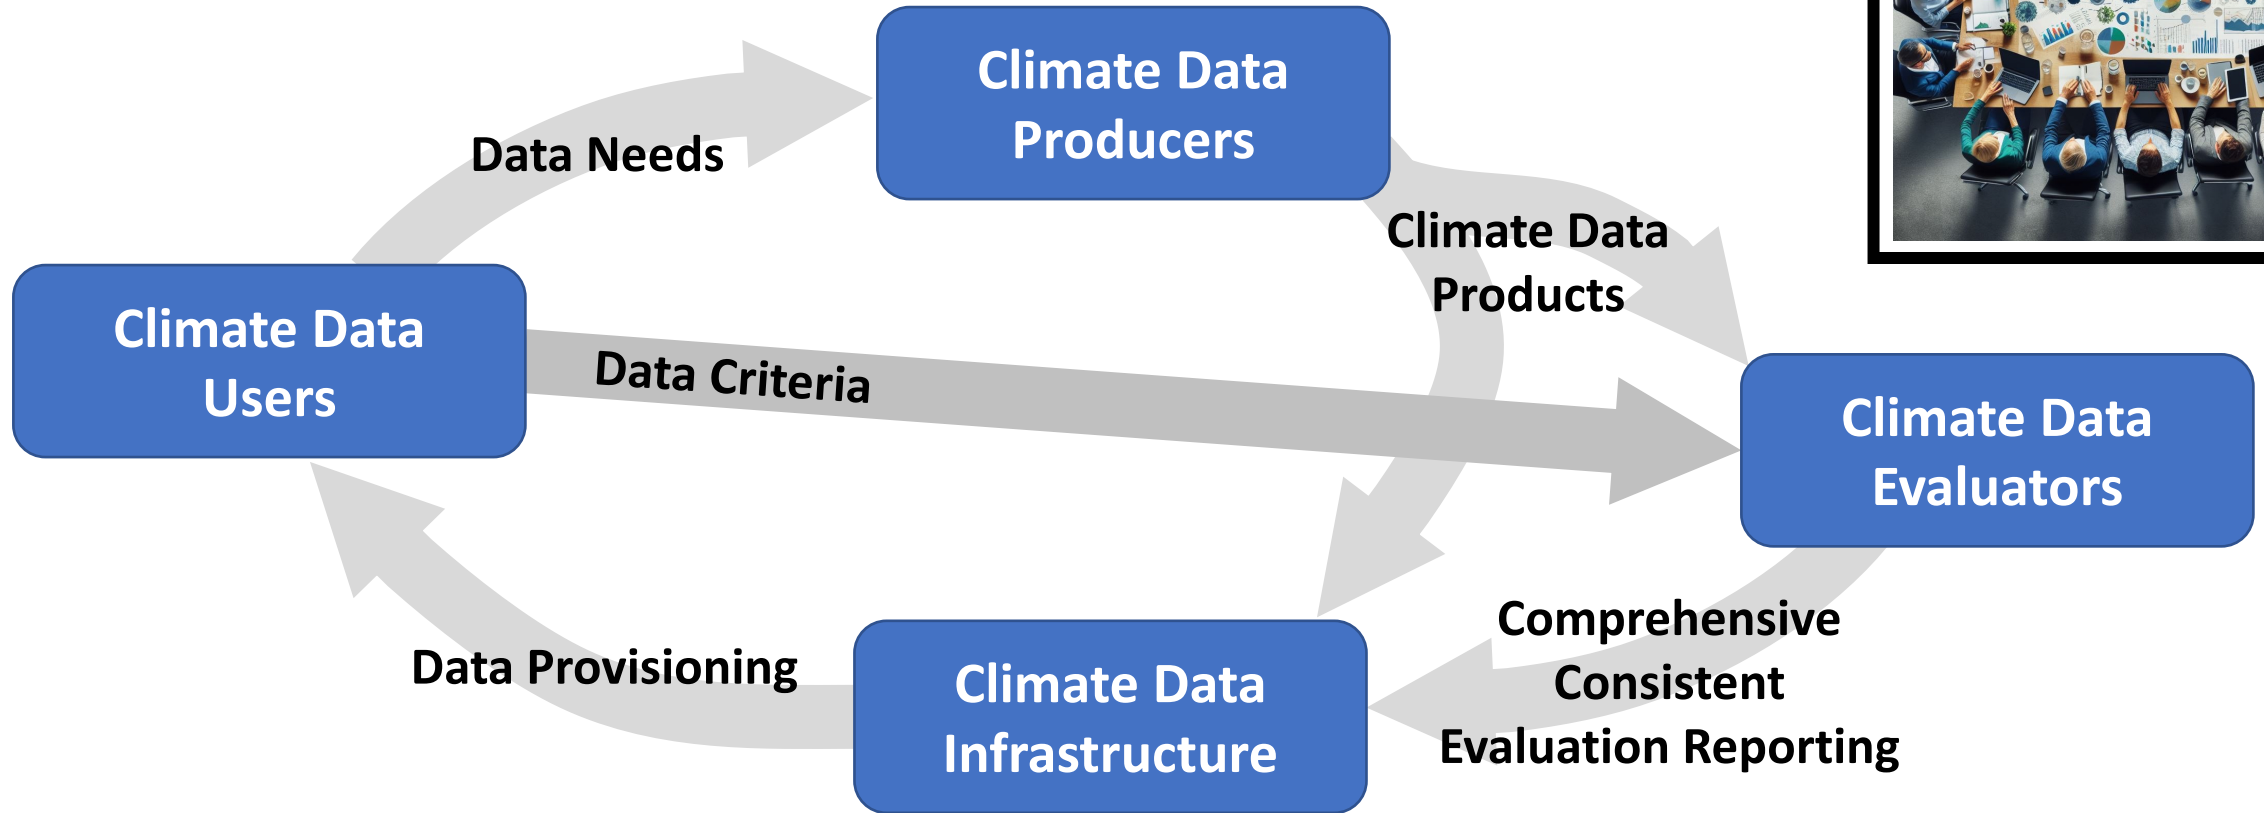

All operational approaches considered, including statistical downscaling, dynamical downscaling, hybrid downscaling, regionally-refined global modeling and AI/ML based methods.

Workshop scope: How to characterize the strengths and weaknesses of decision-relevant climate data products and build bridges between data producers, data analysts and data users.

# *Need for a Community of Practice*

Common standards can streamline communication among community members and reduce the effort necessary to incorporate data in the decision process.

# Summary

- **Many different climate data products** now available using a variety of methods
- Choosing the right climate data product to use can be difficult and confusing
- The NCA5 Atlas provides summaries of two common statistical downscaling products (averaged together): LOCA2 and STAR-ESDM
  - Both of these products are **good choices for future projections** and **largely agree with one another** for projected change
- We are working towards the development of a **community of practice** to better organize efforts on climate data
- Stay Tuned!
